but in the NPRM NHTSA stated instead that it had “not attempted to account for every technology that might conceivably be applied to improve fuel economy and consider[ed] it unnecessary to do so given that many technologies address fuel economy in similar ways.”<sup>2567</sup> The States and Cities commenters stated that “[t]his is an unexplained departure from the agency’s past practice and prior interpretation of ‘technological feasibility,’ citing *Fox Television*, and argued that NHTSA had not explained “1) what ‘similar ways’ means, or 2) why the fact that a technology that might improve fuel economy ‘in similar ways’ to another technology obviates NHTSA’s obligation to consider its availability, particularly given the differences in costs between different technologies.”<sup>2568</sup> The States and Cities commenters pointed to the examples of HCR1 and HCR2 as technologies “already widely available in the market” that should have been considered, and claimed that NHTSA had “failed to even consult with EPA regarding which technologies the agency considered,” “result[ing] in fundamentally flawed predictions of what technology can be applied in model years 2021-2026.”<sup>2569</sup>

Mazda, in contrast, stated that it agreed that “mere development and introduction of advanced fuel efficient technologies is not sufficient for manufacturers to comply with established GHG and fuel efficiency standards. The technologies must be widely adopted by consumers for them to provide the expected environmental benefit.”<sup>2570</sup> Mr. Kreucher stated that manufacturers have been applying “unprecedented levels of technology” but are still falling short of their compliance obligations, pointing in particular to light truck compliance in MY 2016.

Kreucher argued that “[t]his indicates a serious overestimation of technological feasibility in the prior [2012] analysis that must be corrected.”<sup>2571</sup>

UCS stated that the NPRM analysis “undermined” an assessment of “technical feasibility,” by “paint[ing] fuel-saving technologies as less effective and more costly than real-world data indicate,” through several mechanisms.<sup>2572</sup> First, UCS argued that the analysis had underestimated ICE efficiency possibilities, “frequently ignoring technology that is already commercialized or is widely anticipated to be readily available within the timeframe of the standards.”<sup>2573</sup> Second, UCS suggested that the NPRM analysis had “overstate[d] the degree to which manufacturers have deployed some of the most cost-effective technologies, while errors in full vehicle simulation and rampant disregard for the current state of technology underestimates the potential for future improvement.”<sup>2574</sup> UCS claimed that “[f]requently the agencies have departed from past precedence in specific ways *in order to* increase technology costs associated with technology deployment, sometimes failing to provide even a glimmer of reasonable justification for such decisions.”<sup>2575</sup> (emphasis added) Third, UCS argued that the model had been deliberately constructed to avoid choosing the most cost-effective technology pathways, showing higher costs and more future overcompliance than UCS analysis showed.<sup>2576</sup> Finally, UCS argued that better modeling of credit trading and use would further reduce technology costs. UCS concluded that “The mischaracterization of technology and unrealistic model

<sup>2573</sup> *Id.*

<sup>2574</sup> *Id.*

<sup>2575</sup> *Id.*

<sup>2576</sup> *Id.*

construction lead to an inaccurate assessment of technological feasibility, effectively undermining this factor’s weight in considering maximum feasible standards.”<sup>2577</sup>

Contrary to the assertion by several commenters that NHTSA has historically claimed that it *must* set technology-forcing standards, NHTSA has previously described the technological feasibility factor as *allowing* the agency to set standards that force the development and application of new fuel-efficient technologies.<sup>2578</sup> In the same preamble section in which that description was set forth, NHTSA stated that “[i]t is important to remember that technological feasibility must also be balanced with the other of the four statutory factors. Thus, while ‘technological feasibility’ can drive standards higher by assuming the use of technologies that are not yet commercial, ‘maximum feasible’ is also defined in terms of economic practicability, for example, which might caution the agency against basing standards (even fairly distant standards) *entirely* on such technologies.”<sup>2579</sup> NHTSA further stated that “...as the ‘maximum feasible’ balancing may vary depending on the circumstances at hand for the model year in which the standards are set, the extent to which technological feasibility is simply met or plays a more dynamic role may also shift.”<sup>2580</sup>

NHTSA continues to believe that, for purposes of this rulemaking covering standards for MYs 2021-2026, the crucial question is not whether technologies exist to meet the standards—they do. The question is rather, given that the technology exists, how much of it should be required to be added to new cars and trucks in order to conserve more energy, and how to

---

<sup>2577</sup> *Id.*

<sup>2578</sup> *See, e.g.*, 77 FR at 63015 (Oct. 15, 2012).

<sup>2579</sup> *Id.*

<sup>2580</sup> *Id.*

appropriately balance additional energy conserved and additional cost for new vehicles.

Regardless of whether technological feasibility *allows* the agency to set technology-forcing standards, technological feasibility does not *require*, by itself, NHTSA to set technology-forcing standards if other statutory factors would point the agency in a different direction. NHTSA has expressed this interpretation of technological feasibility over the course of multiple rulemakings.<sup>2581</sup> The States and Cities commenters appear, at the root, to be contesting the agency's determination of maximum feasible standards, by way of arguing that NHTSA must interpret the technological feasibility factor as necessarily driving greater energy conservation. The balancing of factors to determine maximum feasible standards is a separate issue, for which EPCA/EISA gives NHTSA considerable discretion.

The States and Cities commenters focus on previous rulemaking language when they suggest that the agency was arbitrary and capricious for not explaining more fully why it need not expressly evaluate every single technology that does or could exist in MYs 2021-2026. While NHTSA stated in 2012 that it had “considered all types of technologies that improve real-world fuel economy, including air-conditioner efficiency and other off-cycle technology, PHEVs, EVs, and highly-advanced internal combustion engines not yet in production,”<sup>2582</sup> that statement was only one in a larger discussion. The 2012 final rule also stated expressly that “[t]here are a number of other potential technologies available to manufacturers in meeting the 2017-2025 standards *that the agencies have evaluated but have not considered* in our final analyses. These include HCCI, ‘multi-air’, and camless valve actuation, and other advanced

---

<sup>2581</sup> *Id.*, see also 75 FR at 25605 (May 7, 2010).

<sup>2582</sup> 77 FR at 63037 (Oct. 15, 2012).

engines currently under development.”<sup>2583</sup> (emphasis added) Thus, even under the prior analysis that some commenters appear to prefer, it is not entirely correct to say that NHTSA had considered *all* technologies in existence or that could exist, because some technologies were clearly and purposely left out of the prior rule’s analysis. In response to commenters’ apparent confusion regarding NHTSA’s statement that it did not consider technologies that improved fuel economy in “similar ways” as other technologies discussed in the NPRM, the meaning behind that statement was discussed at greater length in the section of the NPRM that substantively covered those technologies. For example, in discussing the “HCR2” technology, the agencies explained that while the agencies were not modeling HCR2 expressly due to concerns that it remained “entirely speculative,” “[t]he CAFE model allows for incremental improvement over existing HCR1 technologies with the addition of improved accessory devices (IACC), a technology that is available to be applied on many baseline MY 2016 vehicles with HCR1 engines and may be applied as part of a pathway of compliance to further improve the effectiveness of existing HCR1 engines.”<sup>2584</sup> In this and in other instances, technologies included in the analysis improved fuel economy in similar ways to other technologies not included. Here, HCR1, when combined with IACC, results in “a step past” HCR1, which is similar to the unproven HCR2. As in the 2012 rule, the agencies explained in the NPRM why certain technologies were not considered, and sought comment. In response to comments received, some technologies have been added to the analysis for the final rule. See Section VI for more information.

---

<sup>2583</sup> 77 FR at 62706 (Oct. 15, 2012).

<sup>2584</sup> 83 FR at 43038 (Aug. 24, 2018).

While the agencies respond to many of UCS’s analytical concerns in Sections IV and VI (which include extensive discussion of changes made in response to comments), NHTSA recognizes that some commenters believe that more technologies are “available for deployment” more widely, and sooner, than the final rule’s analysis reflects. This question has long been a topic of debate in CAFE and CO<sub>2</sub> rulemakings—the agencies consider which technologies can be applied to which vehicles in which model years in order to assess the costs and benefits of pushing the industry to reach different levels of standards, which in turn helps to inform stringency determinations. In response to comments, the agencies have expanded the number of technologies and the vehicles to which they may be applied for this final rule, but continue to disagree that certain technologies can be applied widely in the rulemaking timeframe. NHTSA does not believe, for example, that HCCI will be unavailable for widespread application in the rulemaking timeframe because it *wishes* to believe this prediction—NHTSA believes it based on the fact that HCCI has been in the research phase for several decades, and the only production applications to date use a highly-limited version that restricts HCCI combustion to a very narrow range of engine operating conditions. Section VI contains further discussion of these issues.

(2) *Economic Practicability*

“Economic practicability” has traditionally referred to whether a standard is one “within the financial capability of the industry, but not so stringent as to” lead to “adverse economic consequences, such as a significant loss of jobs or unreasonable elimination of consumer choice.”<sup>2585</sup> In evaluating economic practicability, NHTSA considers the uncertainty

---

<sup>2585</sup> 67 FR 77015, 77021 (Dec. 16, 2002).

surrounding future market conditions and consumer demand for fuel economy alongside consumer demand for other vehicle attributes. NHTSA has explained in the past that this factor can be especially important during rulemakings in which the auto industry is facing significantly adverse economic conditions (with corresponding risks to jobs). Consumer acceptability is also a major component of economic practicability,<sup>2586</sup> which can involve consideration of anticipated consumer responses not just to increased vehicle cost, but also to the way manufacturers may change vehicle models and vehicle sales mix in response to CAFE standards. In attempting to determine the economic practicability of attribute-based standards, NHTSA considers a wide variety of elements, including the annual rate at which manufacturers can increase the percentage of their fleet that employs a particular type of fuel-saving technology,<sup>2587</sup> and manufacturer fleet mixes. NHTSA also considers the effects on consumer affordability resulting from costs to comply with the standards, and consumers' valuation of fuel economy, among other things.

Prior to the MYs 2005-2007 rulemaking under the non-attribute-based (fixed value) CAFE standards, NHTSA generally sought to ensure the economic practicability of standards in part by setting them at or near the capability of the "least capable manufacturer" with a significant share of the market, i.e., typically the manufacturer whose fleet mix was, on average, the largest and heaviest, generally having the highest capacity and capability so as not to limit the availability of those types of vehicles to consumers. In the first several rulemakings

---

<sup>2586</sup> *See, e.g.*, *Center for Auto Safety v. NHTSA (CAS)*, 793 F.2d 1322 (D.C. Cir. 1986) (Administrator's consideration of market demand as component of economic practicability found to be reasonable); *see also* *Public Citizen v. NHTSA*, 848 F.2d 256 (Congress established broad guidelines in the fuel economy statute; agency's decision to set lower standards was a reasonable accommodation of conflicting policies).

<sup>2587</sup> For example, if standards effectively require manufacturers to make technologies widely available that consumers do not want, or to make technologies widely available before they are ready to be widespread, NHTSA believes that these standards could potentially be beyond economically practicable.

establishing attribute-based standards, NHTSA applied marginal cost-benefit analysis, considering both overall societal impacts and overall consumer impacts. Whether the standards maximize net benefits has thus been a significant, but not dispositive, factor in the past for NHTSA's consideration of economic practicability. Executive Order 12866, as amended by Executive Order 13563, states that agencies should "select, in choosing among alternative regulatory approaches, those approaches that maximize net benefits. . ." In practice, however, agencies, including NHTSA, must consider that the modeling of net benefits does not capture all considerations relevant to economic practicability. Therefore, as in past rulemakings, NHTSA explained in the NPRM that it was considering net societal impacts, net consumer impacts, and other related elements in the consideration of economic practicability.

NHTSA's consideration of economic practicability depends on a number of elements. Expected availability of capital to make investments in new technologies matters; manufacturers' expected ability to sell vehicles with certain technologies matters; likely consumer choices matter; and so forth. NHTSA explained in the NPRM that NHTSA's analysis of the impacts of the proposal incorporated assumptions to capture aspects of consumer preferences, vehicle attributes, safety, and other elements relevant to an impacts estimate; but stated that it is difficult to capture every such constraint. Therefore, NHTSA explained, it is well within the agency's discretion to deviate from the level at which modeled net benefits are maximized if the agency concludes that that level would not represent the maximum feasible level for future CAFE standards. Economic practicability is complex, and like the other factors must also be considered in the context of the overall balancing and EPCA's overarching purpose of energy conservation. Depending on the conditions of the industry and the assumptions used in the agency's analysis of alternative standards, NHTSA stated that it could well find that standards that maximize net

benefits, or that are higher or lower, could be at the limits of economic practicability, and thus potentially the maximum feasible level, depending on how the other factors are balanced.

NHTSA also stated in the NPRM that while the agency would discuss safety as a separate consideration, NHTSA also considered safety as closely related to, and in some circumstances a subcomponent of, economic practicability. On a broad level, manufacturers have finite resources to invest in research and development. Investment into the development and implementation of fuel saving technology necessarily comes at the expense of investing in other areas such as safety technology. On a more direct level, when making decisions on how to equip vehicles, manufacturers must balance cost considerations to avoid pricing further consumers out of the market. As manufacturers add technology to increase fuel efficiency, they may decide against installing additional safety equipment to reduce cost increases. And as the price of vehicles increase beyond the reach of more consumers, such consumers continue to drive or purchase older, less safe vehicles. In assessing practicability, NHTSA also considers the harm to the Nation's economy caused by highway fatalities and injuries.

CARB, the States and Cities commenters, and UCS all commented that the NPRM analysis, as the States and Cities put it, had “inexplicably inflat[ed] technology costs and rel[ied] on flawed models to predict impacts on vehicle sales.”<sup>2588</sup> Both CBD *et al.* and UCS suggested that it was incorrect to assume that manufacturers would pass on 100 percent of cost increases as price increases to consumers.<sup>2589</sup> UCS further stated that “The agencies have then strategically

---

<sup>2588</sup> CARB, NHTSA-2018-0067-11873, at 79-80; States and Cities, NHTSA-2018-0067-11735, at 69-70; UCS, NHTSA-2018-0067-12039, at 4.

<sup>2589</sup> CBD *et al.*, NHTSA-2018-0067-12057, at 4; UCS, NHTSA-2018-0067-12039, at 4.

excluded well-established academic literature to limit the assumptions used to define a consumer's willingness to pay in ways that further increase costs to consumers and/or decrease the consumer benefits of fuel economy and greenhouse gas emissions.”<sup>2590</sup> UCS argued that assuming full pass-through of cost increases as price increases and assuming that consumers may not fully value improvements in fuel economy “arbitrar[ily] ... depress the sales of highly fuel-efficient vehicles in the model by systematically negating consumer benefits of these vehicles.”<sup>2591</sup> The States and Cities further argued that NHTSA had not “substantiated its concern that an increase in new vehicle prices would place a particular burden on ‘low-income purchasers,’” and stated that NHTSA had “assume[d], without explanation, that” less-stringent fuel economy standards resulted in greater net savings for consumers, which NHTSA “acknowledge[d], without justification, ‘is a significantly different analytical result from the 2012 final rule.’”<sup>2592</sup> The States and Cities commenters implied that this different result and NHTSA’s “failure to acknowledge it” was impermissible under the standard set forth in *Fox Television*.<sup>2593</sup>

A number of commenters stated that the NPRM’s estimates of job losses associated with the proposal conflicted with NHTSA’s concerns about job losses if more stringent standards were promulgated. *CBD et al.* argued that NHTSA could not reasonably conclude that job losses make less-stringent standards more economically practicable than more-stringent standards.<sup>2594</sup> The States and Cities commenters stated that “[b]y declining to address its own findings of

significant job losses in the auto sector, NHTSA has ignored an important aspect of the problem and failed to propose a ‘rational connection between the facts found and the choice made.’”<sup>2595</sup> The States and Cities commenters also argued that “the agency failed to acknowledge or explain its break with its own interpretation and practice of considering whether standards would cause a ‘significant loss of jobs.’”<sup>2596</sup> Some commenters argued that more-stringent standards would create more jobs (and conversely, that less-stringent standards would result in job losses), primarily for supplier companies,<sup>2597</sup> and some noted that other studies had concluded that more-stringent standards would increase employment, citing, for example, the report by Synapse Energy Economics, Inc. on “Cleaner Cars and Job Creation.”<sup>2598</sup> Some commenters further argued that less-stringent standards would hurt U.S. GDP,<sup>2599</sup> and some argued that they would hurt U.S. industry’s international competitiveness because other countries/regions have more stringent standards, and investment may shift to those countries if U.S. standards do not continue to compel it.<sup>2600</sup> The States and Cities commenters stated that failing to address fully “the negative employment and GDP impacts of the Proposed Rollback is an abdication of NHTSA’s clear statutory duty to consider the economic practicability of its proposed standards, and an impermissible interpretation of the statutory text.”<sup>2601</sup>

Commenters disagreed on whether and how NHTSA should consider consumer demand. Mr. Kreucher, the Texas Congressional Delegation,<sup>2602</sup> and Senator Inhofe,<sup>2603</sup> among others, all argued that considering consumer demand for fuel economy was important, while other commenters argued that while it may be permissible for NHTSA to consider consumer demand, NHTSA could not elevate that consideration above others. CARB and the States and Cities commenters both cited language from *CAS v. NHTSA* for the premise that “Congress intended energy conservation to be a long-term effort that would continue through temporary improvements in energy availability. Thus, it would clearly be impermissible for NHTSA to rely on consumer demand to such an extent that it ignored the overarching goal of fuel conservation.”<sup>2604</sup> The Minnesota agencies stated that “making sweeping assumptions about consumer preferences should not trump the clear public benefit to reducing GHG emissions through these standards.”<sup>2605</sup> Mr. Kreucher commented, in contrast, that consumer preferences are driven entirely by “[l]ong term fuel price expectations and fuel price alone,” and disagreed with the historical “implicit assumption that if you build it customers will come.”<sup>2606</sup>

The Minnesota agencies argued that focusing on consumer preferences represented an “unreasonable and unprecedented shift in interpretation.”<sup>2607</sup> The States and Cities commenters stated similarly that NHTSA had “redefined ‘economically practicable’ to categorically exclude standards that, based on some unspecified metric, ‘widely apply technologies that consumers do

<sup>2607</sup> Minnesota agencies, NHTSA-2018-0067-11706, at 4.

not want,” and argued that “NHTSA has offered no explanation for how it would define ‘wide application,’ much less how it would supposedly determine what consumers do or do not want.”<sup>2608</sup> The States and Cities commenters argued that it was internally inconsistent (and therefore arbitrary and capricious) for NHTSA to rely in its justification on concerns about consumer acceptance of technologies, while concurrently “acknowledging the ‘extensive debate over how much consumers do (and/or should) value fuel savings and fuel economy as an attribute in new vehicles’”<sup>2609</sup> The States and Cities commenters stated that the NPRM’s modeling “assume[ed] that consumers assign no value to fuel savings whatsoever,” and that “This assumption is not only implausible but also flies in the face of the Agency’s own statements that consumers likely value between half of and all future fuel savings.”<sup>2610</sup>

With regard to whether consumers *do* want more fuel economy, NESCAUM stated that “the most recent surveys indicate that consumers continue to place a high value on fuel efficient vehicles of all types,”<sup>2611</sup> while Alliance for Vehicle Efficiency stated that “Consumers have adopted incremental changes to new vehicles that increase fuel economy that don’t compromise on power, size or safety.”<sup>2612</sup> The States and Cities commenters argued that “consumer choice is, in fact, enhanced by providing consumers with the option of purchasing higher-efficiency vehicles.”<sup>2613</sup> CBD *et al.* and the States and Cities commenters stated that NHTSA had simply made assertions about consumer demands without supporting evidence,<sup>2614</sup> with the States and

Cities commenters also arguing that the fuel price assumptions in the NPRM were “unsupported” and “contradicted by recent evidence,” despite NHTSA’s arguments that low fuel prices made “fuel efficiency less attractive to consumers.”<sup>2615</sup> Somewhat in contrast, NESCAUM stated that “[g]iven recent consumer preferences for larger vehicles, maximizing fuel efficiency and GHG emission reductions in larger footprint vehicles is even more important,” noting that footprint based standards “are intentionally flexible to accommodate industry and consumer preferences.”<sup>2616</sup> NESCAUM also stated that many HEV/PHEV/EV models are now available and that their sales “reflect[ ] growing consumer acceptance of the technology, ...despite the low availability of electric vehicle models in the Northeast Section 177 States and the auto industry’s continuing failure to actively market [them].”<sup>2617</sup>

Regarding the NPRM’s statement that safety could be a subcomponent of economic practicability, the States and Cities commenters stated that this was “an unreasonable interpretation of this factor, given that safety concerns are not discussed in EPCA and have no direct correlation to whether a standard is economically practicable.”<sup>2618</sup> The States and Cities commenters further stated that “NHTSA has never before analyzed safety considerations as falling under this factor, and fails to explain its reason for doing so now,”<sup>2619</sup> and said that it was “unmoored from reality” for NHTSA to state without support that “[i]nvestment into the development and implementation of fuel saving technology necessarily comes at the expense of

<sup>2618</sup> States and Cities, NHTSA-2018-0067-11735, at 70 (“arbitrary and capricious for agency to rely on factors ‘which Congress has not intended it to consider’”) (citing *Chevron*, 467 U.S. at 843; *State Farm*, 463 U.S. at 43).

<sup>2619</sup> *Id.* (citing *Fox Television*, 556 U.S. at 515).

investing in other areas such as safety technology.”<sup>2620</sup> The States and Cities commenters argued that investment in fuel economy rather than safety “does not explain why safety should be folded into a consideration of whether standards are economically practicable.”<sup>2621</sup> IPI argued that “[i]t is arbitrary for NHTSA to count alleged safety costs as support for its propose [*sic*] rollback both under the economic practicability factor and as its own separate ‘bolster[ing] factor,’ and yet never fully monetize climate- and pollution-related deaths and other welfare impacts under either the need to conserve energy factor nor under the economic practicability factor.”<sup>2622</sup>

In response to these comments, NHTSA continues to believe that it is reasonable to interpret “economic practicability” as the agency has long interpreted it: as a question of whether a standard is one “within the financial capability of the industry, but not so stringent as to” lead to “adverse economic consequences, such as a significant loss of jobs or the unreasonable elimination of consumer choice.”<sup>2623</sup> NHTSA disagrees that this interpretation is new or divergent from past interpretations of economic practicability—this is, to the word, the same interpretation set forth in the 2010 and 2012 final rules, and in multiple earlier rules. Commenters disagreeing with the NPRM’s assessment of economic practicability seem, fundamentally, to be disagreeing with how NHTSA *applied* this interpreted definition of economic practicability to the information then before the agency, and also with the agency’s conclusion of how economic practicability weighed against the other statutory factors.

---

<sup>2620</sup> *Id.*

<sup>2621</sup> *Id.*

<sup>2622</sup> NYU IPI, NHTSA-2018-0067-12213, Appendix, at 6-7.

<sup>2623</sup> 67 FR 77015, 77021 (Dec. 16, 2002).

The following text explains why NHTSA continues to believe that the pieces of the analysis it categorizes as relevant to economic practicability fit within the long-standing definition of that factor. Section VIII.B.4 below will explain how the agency has considered those pieces of the analysis in balancing economic practicability with the other statutory factors.

NHTSA has consistently described the manner in which it applies the “economic practicability” factor, and has given considerable weight to the phrasing of this description. Parsing the words of this description can be useful:

The core of the description is the phrase “within the financial capability of the industry,” but not so stringent as to lead to “adverse economic consequences.” The following clause “such as a significant loss of jobs or the unreasonable elimination of consumer choice” is set off by a comma from “consequences,” and use of the phrase “such as” indicates that it is a nonrestrictive clause.<sup>2624</sup> A nonrestrictive clause means that “significant loss of jobs” and “unreasonable elimination of consumer choice” are *examples* of “adverse economic consequences,” but are not an exclusive list of the possible adverse economic consequences that NHTSA may consider. Further evidence that this clause was intended simply to offer examples comes from the 1977 final rule establishing passenger car standards for MYs 1981-1984, in which NHTSA examined the potential meaning of “economic practicability” at length and concluded that it should be interpreted as “requiring the standards to be within the financial capability of the industry, but

---

<sup>2624</sup>See Strunk, William and E.B. White, *The Elements of Style*, Fourth Edition (2000), Rule 3, at 2-7.

not so stringent as to threaten substantial economic hardship for the industry,” i.e., lacking the final clause.<sup>2625</sup>

A number of commenters took issue with NHTSA’s consideration of consumer demand, citing the 1986 D.C. Circuit decision *CAS v. NHTSA* for the proposition that consumer demand cannot drive the balancing of factors in determining maximum feasible standards. In that case, the D.C. Circuit stated that “[i]t is axiomatic that Congress intended energy conservation to be a long term effort that would continue through temporary improvements in energy availability. Thus, it would clearly be impermissible for NHTSA to rely on consumer demand to such an extent that it ignored the overarching goal of fuel conservation.”<sup>2626</sup> NHTSA agrees that the *CAS* decision makes this point, and that the 9<sup>th</sup> Circuit decision in *CBD v. NHTSA* also underscored that the overarching purpose of EPCA is energy conservation. That said, the *CAS* decision also contains a number of other points that are relevant both to the facts at hand in *this* rulemaking and NHTSA’s current use of consumer demand as an aspect of economic practicability and as a consideration in determining maximum feasible standards. NHTSA will discuss *CAS* more extensively below in Section VIII.B.4, but this section will cover it briefly, specifically with respect to NHTSA’s interpretation of economic practicability.

As noted in the NPRM and in the 2012 final rule, the *CAS* decision found NHTSA’s consideration of market demand as a component of economic practicability reasonable.<sup>2627</sup> In

---

<sup>2625</sup> 42 FR 33534, 33537 (Jun. 30, 1977). It is worth noting that the agency considered and rejected an interpretation of economic practicability at that time based solely on cost-benefit analysis, stating “A cost-benefit analysis would be useful in considering these factors [of economic practicability], but sole reliance on such an analysis would be contrary to the mandate of the act.” *Id.*

<sup>2626</sup> *CAS*, 793 F.2d 1322, 1340 (D.C. Cir. 1986).

<sup>2627</sup> 83 FR at 43208, fn. 402; 77 FR at 62668, fn. 111 (both citing *CAS*, 793 F.2d 1322, 1338 (D.C. Cir. 1986)).

*CAS*, petitioners the Center for Auto Safety, Public Citizen, Union of Concerned Scientists, and Environmental Policy Institute sued NHTSA over CAFE standards for MY 1986, arguing that NHTSA could not determine stringency on the basis of low expected consumer demand for fuel economy, and “that technology permitted greater fuel savings and that the statutorily required ‘maximum feasible’ level of fuel economy is higher than the standard” determined by NHTSA.<sup>2628</sup> The court followed *Chevron* in evaluating whether NHTSA could consider consumer demand, and found that Congress had not directly spoken to the consideration of consumer demand. The court then assessed whether NHTSA’s interpretation of the statute “represents a reasonable accommodation of conflicting policies that were committed to the agency’s care by statute,” stating that “The agency’s interpretation of the statutory requirements is due considerable deference and must be found adequate if it falls within the range of permissible constructions.”<sup>2629</sup>

In assessing NHTSA’s interpretation, the court stated that “Consumer demand is not specifically designated as a factor, but neither is it excluded from consideration; the factors of ‘technological feasibility’ and ‘economic practicability’ are each broad enough to encompass the concept. Thus, the unadorned language of the statute does not indicate a congressional intent concerning the precise objections raised by the petitioners.” The court then examined EPCA’s legislative history and concluded that “this language neither precludes nor requires lower standards when consumer demand for heavy vehicles is strong. The agency is directed to weigh the ‘difficulties of individual automobile manufacturers;’ there is no reason to conclude that

---

<sup>2628</sup> *CAS*, at 1328.

<sup>2629</sup> *CAS*, at 1338.

difficulties due to consumer demand for a certain mix of vehicles should be excluded.”<sup>2630</sup> The court even noted that “the petitioners [did] not challenge the consideration of consumer demand *per se*, but rather the weight the agency has given the factor in downgrading standards...”<sup>2631</sup>

NHTSA continues to believe that it is reasonable to consider consumer demand as an element of economic practicability, as the *CAS* court recognized. Comments objecting to the consideration of consumer demand appear to focus more, like the petitioners in *CAS*, on the agency’s focus on consumer demand in the overall balancing of factors to determine what CAFE standards would be maximum feasible, insofar as they are expressing concern about consumer demand undermining energy conservation. Again, this question will be addressed further in Section VIII.B.4 below. To the extent that commenters dispute *any* consideration of consumer demand, the D.C. Circuit put that question to rest decades ago.

Related to the agency’s consideration of consumer demand, a number of commenters took issue with the agencies’ estimates of the cost of meeting higher fuel economy standards, arguing essentially that the analysis was deliberately constructed to inflate costs and minimize consumer willingness to pay for fuel economy improvements in order to arrive at a policy conclusion that higher fuel economy standards would not be economically practicable. NHTSA does not believe that commenters mean to argue with the agency’s legal interpretation (i.e., the *consideration* of cost as an aspect of economic practicability), but rather with the agencies’ analytical findings which inform that consideration. Comments on those analytical findings, and the agencies’ responses and changes to the analysis in response to those comments, are discussed

---

<sup>2630</sup> *CAS*, at 1338-1339.

<sup>2631</sup> *CAS*, at 1340.

in Sections VI and VII above. Consumer willingness to pay for additional fuel economy in their new vehicles, in particular, is represented throughout the final rule analysis as 2.5 years—that is, that consumers value, and manufacturers will voluntarily add, fuel economy-improving technology that pays for itself in fuel savings within 2.5 years.

More generally, NHTSA believes that the cost of meeting CAFE standards is inherently relevant to assessing whether those standards are “within the financial capability of the industry but not so stringent as to lead to adverse economic consequences,” for two primary reasons. First, vehicle manufacturers tend to have relatively fixed budgets for R&D and production, which are tied to overall revenues. If more of those budgets are spent on improving fuel economy, less of those budgets are available to spend on other vehicle characteristics (such as advanced safety features, or better performance or utility) that might improve sales. Offering less of those other vehicle characteristics in a market where many consumers are not particularly focused on fuel economy could lead to adverse economic consequences for those manufacturers. Manufacturers cannot simply increase budgets or turn limited resources toward supplying more of vehicle characteristics that do not motivate most sales. To the extent that more stringent standards drive manufacturing costs higher and those costs are passed forward to consumers in the form of price increases, those price increases can affect vehicle sales to some extent. NHTSA understands that some commenters disagree that higher manufacturing costs are necessarily passed forward to consumers in the way that the agencies have modeled them being passed forward, but the agencies do not have adequate information on which to base a different approach. Commenters disagreeing with this approach generally object on two fronts: first, because they believe that automakers cross-subsidize cost increases by raising the prices of certain models rather than all models, and second, because they believe that automakers could

absorb regulatory costs and reduce profits. The agencies do not have enough information to model either of those issues in a meaningful way. Some amount of cross-subsidization no doubt occurs, but automakers closely hold pricing strategy information. The agencies do not attempt to model automakers voluntarily reducing profits in response to standards, again in part because the agencies do not have sufficient information, but also because these companies are publicly-traded and taking losses is not a long-term solution for companies whose success is measured by profitability. NHTSA believes that the analytical approach used today is reasonable given the information available to the agencies. While today's analysis does not show large sales effects due to price increases, and even accounting for fuel economy differences in this final rule *still* does not show large sales effects, it seems reasonable to call negative sales effects "adverse economic consequences."

Also related to consumer demand, NHTSA has previously considered manufacturer "shortfalls" as an aspect of economic practicability.<sup>2632</sup> The CAFE standards are corporate average standards, by definition, giving manufacturers the flexibility to decide how to distribute fuel economy-improving technologies throughout their fleet. In other words, no given vehicle need, itself, meet a standard or even its "target" on the target curve, as long as the fleet as a whole meets the standard. However, CAFE compliance is measured on a sales-weighted basis, so if a manufacturer ultimately sells more vehicles that perform poorly relative to their targets than it sells vehicles that beat their targets, the manufacturer may fall short of its compliance obligation despite having applied fuel economy-improving technologies in amounts that the manufacturer originally anticipated would result in compliance. Recent compliance trends have

---

<sup>2632</sup> See 77 FR at 63040-43 (Oct. 15, 2012).

illustrated this phenomenon, as discussed in Section IV above. When fuel is relatively inexpensive, Americans tend to be less interested in saving money on fuel, and thus less interested in fuel economy as compared to other vehicle attributes. Compliance shortfalls represent this consumer decision-making playing out in the market, and can thus be evidence of economic impracticability if sufficiently widespread.<sup>2633</sup>

As with the above-discussed aspects of economic practicability, commenters who objected to NHTSA's consideration of employment impacts disagreed less with the principle of considering employment impacts, and more with how NHTSA discussed employment impacts in the proposal's justification given the NPRM's findings on employment. Namely, the NPRM included a simplistic analysis that converted reduced technology costs under the preferred alternative relative to the augural standards into "job years" metric and estimated U.S. auto sector labor would be slightly reduced under the proposal as compared to under the augural standards (reflecting those reduced technology costs). Although new vehicle sales increased slightly under the NPRM's preferred alternative, this was offset because "manufacturing, integrating, and selling less technology means using less labor to do so."<sup>2634</sup> However, NHTSA expressed concern in the proposal justification section that "there could be potential for...loss of U.S. jobs...under nearly all if not all of the regulatory alternatives considered...."<sup>2635</sup> A number of commenters argued that if more stringent standards led to higher employment, as the NPRM

---

<sup>2633</sup> See, e.g., Alliance comments (Full Comment Set) at 25-29, describing automaker shortfalls in terms of fleet fuel economy increases required by augural and prior standards.

<sup>2634</sup> 83 FR at 43436 (Aug. 24, 2018).

<sup>2635</sup> *Id.* at 43216.

(and also outside analyses) appeared to show, there was no way that less stringent standards could be *more* economically practicable.

As in the NPRM, NHTSA recognizes that the employment analysis for this final rule does not capture certain potential effects that may be important. NHTSA explained in the NPRM that the NPRM's employment analysis did not account for the risks that vehicle sales may be facing a bubble situation, or that manufacturers facing higher production costs might choose to move production overseas.<sup>2636</sup> This topic is discussed at greater length in Section VIII.B.4 below.

Commenters addressing NHTSA's consideration of safety as an aspect of economic practicability argued generally that EPCA did not call for discussion of safety concerns, and that it was unreasonable to assume that requiring higher levels of fuel economy might preclude investment in further vehicle safety improvements. NHTSA has already explained above that the long-standing definition of "economic practicability" lists example "adverse economic consequences" in a nonrestrictive clause format, meaning that other things besides employment and consumer choice impacts could cause economic consequences and be relevant to economic practicability. NHTSA believes that it is reasonable and appropriate to consider some aspects of safety as part of its consideration of economic practicability, because NHTSA continues to believe that vehicle manufacturers have finite budgets for R&D and production that may be spent on fuel economy improvements when they may otherwise be spent on safety improvements, among other things that consumer value. Some commenters said that that was not a reasonable

---

<sup>2636</sup> *Id.* at 43224-25.

assumption, but it is supported by statements from vehicle manufacturers,<sup>2637</sup> and NHTSA does not have a reason to disbelieve that companies have limited budgets. Moreover, case law does not object to consideration of safety as an aspect of economic practicability.<sup>2638</sup> With regard to IPI's comment about monetization of climate and pollution-related deaths and other welfare impacts, the social cost of carbon and criteria pollutant damages estimates are intended to account for these impacts, and are considered both as part of the cost-benefit analysis and under the environmental implications aspect of the need of the U.S. to conserve energy. Given that the decision about what standards are "maximum feasible" is made by considering all of the factors, it is therefore less relevant under which factor a given issue is considered, so long as it is appropriately considered. To the extent that IPI disagrees with those estimated valuations, Section VI discusses comments on those topics and the agencies' responses.

Based on the above, NHTSA continues to believe that its interpretation of economic practicability is reasonable. Section VIII.B.4 will discuss how NHTSA has considered and balanced economic practicability for this final rule, and also respond to comments that addressed the NPRM's application of economic practicability to the information before the agency at that time.

---

<sup>2637</sup> See, e.g., Toyota comments at 6, NHTSA-2018-0067-12098 ("There are now more realistic limits placed on the number of engines and transmissions in a powertrain portfolio which better recognizes manufacturers must manage limited engineering resources and control supplier, production, and service costs.").

<sup>2638</sup> *Competitive Enterprise Institute v. NHTSA*, 901 F.2d 107, 120, n. 11 ("Petitioners have never clearly identified the precise statutory basis on which safety concerns should be factored into the CAFE scheme, although they alluded to occupant safety as part of the 'economic practicability' criterion in their MY 1989 petition to NHTSA and at oral argument. We do not find this failure fatal, however, because NHTSA has always examined the safety consequences of the CAFE standards in its overall consideration of relevant factors since its earliest rulemaking under the CAFE program, (citations omitted). Moreover, NHTSA itself believes Congress was cognizant of safety issues when it enacted the CAFE program. As evidence, NHTSA discusses a congressional report that dealt with the safety consequences of a downsized fleet of cars which had been considered by Congress during its enactment of the CAFE program.").

(3) *The Effect of Other Motor Vehicle Standards of the Government on Fuel Economy*

“The effect of other motor vehicle standards of the Government on fuel economy” involves analysis of the effects of compliance with emission, safety, noise, or damageability standards on fuel economy capability and thus on average fuel economy. In many past CAFE rulemakings, NHTSA has said that it considers the adverse effects of other motor vehicle standards on fuel economy. It said so because, from the CAFE program’s earliest years<sup>2639</sup> until recently, the effects of such compliance on fuel economy capability over the history of the CAFE program have been negative ones. For example, safety standards that have the effect of increasing vehicle weight thereby lower fuel economy capability, thus decreasing the level of average fuel economy that NHTSA can determine to be feasible. In the analyses for both the NPRM and this final rule, NHTSA has considered the additional weight that it estimates would be added in response to new safety standards during the rulemaking timeframe.<sup>2640</sup> NHTSA has also accounted for EPA’s “Tier 3” standards for criteria pollutants in its estimates of technology effectiveness in both the NPRM and final rule analyses.<sup>2641</sup>

NHTSA discussed in the NPRM whether to consider EPA’s CO<sub>2</sub> standards as an “other motor vehicle standard of the Government” among the other regulations typically considered, and if so, how. NHTSA explained that in the 2012 final rule establishing CAFE standards for MYs 2017-2021, NHTSA recognized that “To the extent the GHG standards result in increases

---

<sup>2639</sup> 42 FR 63184, 63188 (Dec. 15, 1977). *See also* 42 FR 33534, 33537 (Jun. 30, 1977).

<sup>2640</sup> PRIA, Chapter 5; FRIA, Section 5.

<sup>2641</sup> PRIA, Chapter 6; FRIA, Section 6.

in fuel economy, they would do so almost exclusively as a result of inducing manufacturers to install the same types of technologies used by manufacturers in complying with the CAFE standards.”<sup>2642</sup> NHTSA concluded in 2012 that “no further action was needed” because “the agency had already considered EPA’s [action] and the harmonization benefits of the National Program in developing its own [action].”<sup>2643</sup>

In the NPRM, NHTSA considered the issue afresh, and determined that it was clear based on a purely textual analysis of the statutory language that EPA’s CO<sub>2</sub> standards applicable to light-duty vehicles are literally “other motor vehicle standards of the Government,” in that they are standards set by a Federal agency that apply to motor vehicles. Basic chemistry makes fuel economy and tailpipe CO<sub>2</sub> emissions two sides of the same coin, as discussed at length above, and when two agencies functionally regulate both (because when regulating fuel economy, CO<sub>2</sub> emissions are necessarily also regulated, and vice versa), it would be absurd not to link the standards.<sup>2644</sup> The global warming potential of N<sub>2</sub>O, CH<sub>4</sub>, and HFC emissions are not closely linked with fuel economy, but neither do they affect fuel economy capabilities. Simply concluding that EPA’s CO<sub>2</sub> standards *were* “other motor vehicle standards of the Government,” however, did not answer *how* should NHTSA should consider them.

NHTSA acknowledged in the NPRM that some stakeholders had previously suggested that NHTSA should implement this statutory factor by letting EPA decide what CO<sub>2</sub> standards are appropriate and reasonable under the CAA and then simply setting CAFE standards with

---

<sup>2642</sup> 77 FR 62624, 62669 (Oct. 15, 2012).

<sup>2643</sup> *Id.*

<sup>2644</sup> In fact, EPA includes tailpipe CH<sub>4</sub>, CO, and CO<sub>2</sub> in the measurement of tailpipe CO<sub>2</sub> for CO<sub>2</sub> compliance using a carbon balance equation so that the measurement of tailpipe CO<sub>2</sub> exactly aligns with the measurement of fuel economy for the CAFE compliance.

reference to CO<sub>2</sub> stringency. NHTSA disagreed that such an approach would be a reasonable interpretation of EPCA, explaining that while EPA and NHTSA consider some similar factors under the CAA and EPCA/EISA, respectively, they are not identical, and standards that are appropriate under the CAA may not be “maximum feasible” under EPCA/EISA, and vice versa. Moreover, NHTSA explained, considering EPCA’s language in the context in which it was written, it seemed unreasonable to conclude that Congress intended EPA to dictate CAFE stringency. In fact, Congress clearly separated NHTSA’s and EPA’s responsibilities for CAFE under EPCA by giving NHTSA authority to set standards and EPA authority to measure and calculate fuel economy. If Congress had wanted EPA to set CAFE standards, it could have given that authority to EPA in EPCA or at any point since Congress amended EPCA.<sup>2645</sup>

NHTSA explained that NHTSA and EPA are obligated by Congress to exercise their own independent judgment in fulfilling their statutory missions, even though both agencies’ regulations affect both fuel economy and CO<sub>2</sub> emissions. Because of this relationship, it is incumbent on both agencies to coordinate and look to one another’s actions to avoid unreasonably burdening industry through inconsistent regulations,<sup>2646</sup> but both agencies’ programs must stand on their own merits. As with other recent CAFE and CO<sub>2</sub> rulemakings, NHTSA explained that the agencies were continuing to do all of these things in the proposal.

With regard to standards issued by the State of California, the NPRM explained that State tailpipe standards (whether for CO<sub>2</sub> or for other pollutants) do not qualify as “other motor

---

<sup>2645</sup> The NPRM noted, for instance, that EISA was passed after the *Massachusetts v. EPA* decision by the Supreme Court. If Congress had wanted to amend EPCA in light of that decision, it would have done so at that time, but did not.

<sup>2646</sup> *Massachusetts v. EPA*, 549 U.S. 497, 532 (2007) (“[T]here is no reason to think the two agencies cannot both administer their obligations and yet avoid inconsistency.”).

vehicle standards of the Government” under 49 U.S.C. 32902(f), and that therefore, NHTSA would not consider them as such in proposing maximum feasible average fuel economy standards. NHTSA explained that States may not adopt or enforce standards related to fuel economy standards, which are preempted under EPCA, regardless of whether EPA granted any waivers under the Clean Air Act (CAA).

NHTSA and EPA agreed in the NPRM that State tailpipe CO<sub>2</sub> emissions standards do not become Federal standards and qualify as “other motor vehicle standards of the Government,” when subject to a CAA preemption waiver. NHTSA stated that EPCA’s legislative history supports that position, as follows:

EPCA, as initially passed in 1975, mandated average fuel economy standards for passenger cars beginning with model year 1978. The law required the Secretary of Transportation to establish, through regulation, maximum feasible fuel economy standards<sup>2647</sup> for model years 1981 through 1984 with the intent to provide steady increases to achieve the standard established for 1985 and thereafter authorized the Secretary to adjust that standard.

For the statutorily-established standards for model years 1978-1980, EPCA provided each manufacturer with the right to petition for changes in the standards applicable to that manufacturer. A petitioning manufacturer had the burden of demonstrating a “Federal fuel economy standards reduction” was likely to exist for that manufacturer in one or more of those model years and that it had made reasonable technology choices. “Federal standards,” for that

---

<sup>2647</sup> As is the case today, EPCA required the Secretary to determine “maximum feasible average fuel economy” after considering technological feasibility, economic practicability, the effect of other Federal motor vehicle standards on fuel economy, and the need of the Nation to conserve energy. 15 U.S.C. 2002(e) (recodified July 5, 1994).

limited purpose, included not only safety standards, noise emission standards, property loss reduction standards, and emission standards issued under various Federal statutes, but also “*emissions standards applicable by reason of section 209(b) of [the CAA]*.”<sup>2648</sup> (Emphasis added). Critically, all definitions, processes, and required findings regarding a Federal fuel economy standards reduction were located within a single self-contained subsection of 15 U.S.C. 2002 that applied only to model years 1978-1980.<sup>2649</sup>

In 1994, Congress recodified EPCA. As part of this recodification, the CAFE provisions were moved to Title 49 of the United States Code. In doing so, unnecessary provisions were deleted. Specifically, the recodification eliminated subsection (d). The House report on the recodification declared that the subdivision was “executed,” and described its purpose as “[p]rovid[ing] for modification of average fuel economy standards for model years 1978, 1979, and 1980.”<sup>2650</sup> It is generally presumed, when Congress includes text in one section and not in another, that Congress knew what it was doing and made the decision deliberately.

NHTSA stated in the NPRM that it had previously considered the impact of California’s Low Emission Vehicle standards in establishing fuel economy standards and occasionally has done so under the “other standards” sections.<sup>2651</sup> During the 2012 rulemaking, NHTSA sought comment on the appropriateness of considering California’s tailpipe CO<sub>2</sub> emission standards in

---

<sup>2648</sup> Section 202 of the CAA (42 U.S.C. 7521) requires EPA to prescribe air pollutant emission standards for new vehicles; Section 209 of the CAA (42 U.S.C. 7543) preempts state emissions standards but allows California to apply for a waiver of such preemption.

<sup>2649</sup> As originally enacted as part of Public Law 94-163, that subsection was designated as section 502(d) of the Motor Vehicle Information and Cost Savings Act.

<sup>2650</sup> H.R. Rep. No. 103-180, at 583-584, tbl. 2A.

<sup>2651</sup> See, e.g., 68 FR 16896, 71 FR 17643.

this section and concluded that doing so was unnecessary.<sup>2652</sup> In light of the legislative history discussed above, however, NHTSA stated in the NPRM that such consideration would be inappropriate, and confirms that consideration of California’s LEV standards as among the “other standards of the Government” was inappropriate.

Commenters addressing criteria pollutant standards generally supported NHTSA’s approach in the NPRM. AFPM commented that NHTSA “must consider the effect on fuel economy of EPA’s Title II standards, including the use of catalytic converters, PM traps and other technologies that address emissions and have a fuel economy impact.”<sup>2653</sup> Ford also stated that previous analyses “did not assess the impact of the criteria pollutant emission standards that were adopted subsequent to the [2012 final rule],” which Ford said “increased the challenge of meeting the fuel economy and GHG targets and should be taken into consideration.”<sup>2654</sup> Ford stated that the NPRM appropriately included “updat[ed] core engine maps using correct, regular-grade octane test fuel,” and that it accounts for “ultra-low 2025 MY Tier 3 and LEV VIII emissions standards [which] will require aggressive cold start strategies [that] consume additional fuel at start-up in order to rapidly heat the catalyst to an effective operating temperature, which degrades CO<sub>2</sub> and fuel economy performance on the FTP test [and] was not considered previously....”<sup>2655</sup>

Regarding how NHTSA should consider EPA’s CO<sub>2</sub> standards as “other motor vehicle standards of the Government,” ACEEE suggested amongst its comments that, in considering

---

<sup>2652</sup> See 77 FR 62669.

<sup>2653</sup> AFPM, NHTSA-2018-0067-12078, at 52.

<sup>2654</sup> Ford, NHTSA-2018-0067-11928, at 7.

<sup>2655</sup> *Id.*

EPA’s CO<sub>2</sub> standards, “NHTSA should not weaken its program ... to compensate for ... inevitable, modest differences” between EPA’s and NHTSA’s programs.<sup>2656</sup> “Indeed, to the extent that differences in the requirements of the two programs remain, it is clear that the more stringent requirement in any given respect should govern the obligations of the manufacturer.”<sup>2657</sup> AFPM commented similarly that “Although NHTSA must consider the effect of other governmental regulations, Congress intended that NHTSA would have exclusive authority over a single set of national fuel economy standards.”<sup>2658</sup> Mr. Dotson expressed his belief that “Congress was cognizant of the relationship between EPCA and the Clean Air Act when crafting EISA” and cited and discussed various types of legislative history for the proposition that EISA had not limited EPA’s CAA authority, and that various legislative efforts to do so had been put forth in some fashion and had failed.<sup>2659</sup>

NHTSA agrees that while it is appropriate for NHTSA to coordinate with and look to EPA’s actions to avoid unreasonably burdening industry through inconsistent regulations, it would not be appropriate for NHTSA to reduce stringency below levels it believes to be maximum feasible solely for purposes of accommodating differences between programmatic flexibilities. The 2012 final rule clearly stated that while the agencies had made efforts to align their standards, programmatic differences existed, and how manufacturers chose to rely on compliance flexibilities could affect the relative stringency of NHTSA’s and EPA’s standards:

---

<sup>2656</sup> ACEEE, NHTSA-2018-0067-12122, joint NGO comment to Alliance/Global petition for flexibilities, at 3.

<sup>2657</sup> *Id.*

<sup>2658</sup> AFPM, NHTSA-2018-0067-12078, at 52.

<sup>2659</sup> Dotson, EPA-HQ-OAR-2018-0283-4132, Appendix A, at A2-A23. NHTSA disagrees with the persuasiveness of the legislative history cited by Mr. Dotson, which includes floor debates, colloquies, and other similar information that does not reflect the agreement of the Congress as a whole. NHTSA looks to the language Congress actually passed and the President signed into law.

We note, however, that the alignment is based on the assumption that manufacturers implement the same level of direct A/C system improvements as EPA currently forecasts for those model years, and on the assumption of PHEV, EV, and FCV penetration at specific levels. If a manufacturer implements a higher level of direct A/C improvement technology (although EPA predicts 100% of manufacturers will use substitute refrigerants by MY 2021, and the GHG standards assume this rate of substitution) and/or a higher penetration of PHEVs, EVs and FCVs, then NHTSA's standards would effectively be more stringent than EPA's. Conversely, if a manufacturer implements a lower level of direct A/C improvement technology and/or a lower penetration of PHEVs, EVs and FCVs, then EPA's standards would effectively be more stringent than NHTSA's. Several manufacturers commented on this point and suggested that this meant the standards were not aligned, because NHTSA's standards might be more stringent in some years than EPA's. This reflects a misunderstanding of the agencies' purpose. The agencies have sought to craft harmonized standards such that manufacturers may build a single fleet of vehicles to meet both agencies' requirements. That is the case for these final standards. *Manufacturers will have to plan their compliance strategies considering both the NHTSA standards and the EPA standards and assure that they are in compliance with both, but they can still build a single fleet of vehicles to accomplish that goal.*<sup>2660</sup>

Thus, NHTSA has been consistent in its position that CO<sub>2</sub> stringency does not and should not, by itself, dictate CAFE stringency. That said, consideration of EPA's standards was inherent in development of this final rule, given that the same technologies improve fuel economy and reduce CO<sub>2</sub> emissions, and given that CO<sub>2</sub> emissions represent the majority of GHGs produced by light-duty vehicles, and given that the agencies have conducted the analysis for this rulemaking jointly. NHTSA believes that EPA's standards have been fully and appropriately considered as part of its decision on these final standards. To be clear, NHTSA did not assert in the NPRM that EISA constrained EPA's authorities under the CAA and do not disagree with that aspect of Mr. Dotson's comment.

---

<sup>2660</sup> 77 FR at 63054-55 (Oct. 15, 2012) (emphasis added).

Chemours argued that, contrary to the NPRM’s statements about having considered EPA’s GHG standards in developing the proposal, NHTSA had *not* adequately considered EPA’s GHG standards because only the no-action alternative reflected EPA regulation of the non-CO<sub>2</sub> GHGs, and the analysis did not otherwise account for the non-CO<sub>2</sub> GHG standards.<sup>2661</sup> Chemours stated that those standards were “required, pursuant to CAA section 202(a), to address ‘air pollution’ from mobile sources,” and that “No assessment was done as to whether such standards could be made less stringent in order to avoid the various issues identified (*e.g.*, changes in technology since the 2012 final rule, costs to consumers, the effect of ‘diminishing returns,’ a changed petroleum market and other factors.”<sup>2662</sup>

NHTSA disagrees that it was necessary for NHTSA to consider EPA’s standards for non-CO<sub>2</sub> GHG emissions any further than as discussed above. Regulation of CH<sub>4</sub>, N<sub>2</sub>O, and HFCs affects fuel economy only indirectly, if at all. As explained above and in the 2012 final rule, while NHTSA recognizes that some manufacturers may choose paths to compliance with EPA’s GHG standards that make their compliance with CAFE standards more challenging, the agencies previewed this possibility and stated their expectation that manufacturers could make these decisions for themselves. To the extent that Chemours is asking NHTSA to examine regulatory alternatives reflecting less stringent CAFE standards in light of changed conditions since the 2012 final rule, that is exactly what the NPRM and final rule analyses have done.

A number of commenters disagreed with NHTSA’s explanation of how State standards need not be considered under this factor. The States and Cities commenters stated that NHTSA

<sup>2661</sup> Chemours, NHTSA-2018-0067-12018, at 25.

<sup>2662</sup> *Id.* at 25-26.

was required to consider State tailpipe standards because 49 U.S.C. 32902(f) does not specify that “Government” refers only to “Federal” government; because NHTSA had not offered compelling evidence or arguments that Congress did *not* intend NHTSA to consider State tailpipe standards; and because “case law ... states unequivocally that California’s standards must be considered by NHTSA under this factor [citing *Green Mountain Chrysler’s* “federalizing” language].”<sup>2663</sup> The States and Cities commenters further argued that NHTSA was trying to argue simultaneously that it could not consider State standards under the “other standards” factor but *could* consider State standards “under other EPCA factors, if and when it sees fit” (citing NPRM language that technological feasibility and economic practicability are broad factors allowing NHTSA to consider elements not specifically designated by Congress).<sup>2664</sup> The States and Cities commenters further argued, citing *Fox Television*, that NHTSA was deviating from past practice without a reasoned explanation by not specifically requesting comment in the NPRM on the fact that it was not considering California’s standards as “other motor vehicle standards of the Government.”<sup>2665</sup>

With regard to NHTSA’s analysis of EPCA’s original language for MYs 1978-80 and the 1994 positive law recodification, the States and Cities commenters stated that “NHTSA’s statutory and legislative history arguments related to standards for model years 1978-1980 lack merit, as NHTSA has provided no reasonable argument that Congress meant NHTSA to consider

---

<sup>2663</sup> States and Cities, NHTSA-2018-0067-12018, at 71.

<sup>2664</sup> *Id.* at 71-72.

<sup>2665</sup> *Id.* at 72. Fox Television did not involve a rulemaking, and does not require agencies to specifically seek public comment when they deviate from past practice. In any event, by articulating in the NPRM that NHTSA was not considering California’s standards as “other motor vehicle standards of the Government” the public had ample opportunity to provide comment on this issue, and commenters in fact did so as discussed above.

a wider range of standards for those years than for others,” and stated that the section in question “was removed from the statute because it expired, not because Congress took issue with NHTSA’s consideration of California’s waiver standards.”<sup>2666</sup> Mr. Dotson commented similarly that NHTSA could not rely on the 1994 positive law codification as basis to conclude that State tailpipe standards (whether for GHGs or other emissions) do not qualify as “other motor vehicle standards of the Government,” because it said “without substantive change....”<sup>2667</sup>

Additionally, the States and Cities commenters stated that NHTSA could not argue that California’s emissions standards are not “other motor vehicle standards of the Government” because they are preempted, because NHTSA “has no authority to decide whether or not California’s standards are preempted,” and “one of the reasons California’s Advanced Clean Cars program is not preempted by EPCA is *because* those standards are ‘other motor vehicle standards of the Government’ within the meaning of EPCA.”<sup>2668</sup> Besides this comment, a number of comments were submitted regarding NHTSA’s statements in the NPRM about EPCA’s preemption provision and how it applied to California’s standards. Those comments have been addressed<sup>2669</sup> as part of the separate final rule published on September 27, 2019,<sup>2670</sup> and will not be discussed further as part of this action.

NHTSA affirms that its interpretation set forth in the NPRM that “other motor vehicle standards of the Government” does not apply to State emissions standards that relate to fuel

---

<sup>2666</sup> *Id.* at 71.

<sup>2667</sup> Dotson, EPA-HQ-OAR-2018-0283-4132, Appendix A, at A23-A24.

<sup>2668</sup> States and Cities, NHTSA-2018-0067-12018, at 71.

<sup>2669</sup> To the extent that any individual comment was not specifically addressed, NHTSA believes that the substance and themes of all substantive comments on EPCA preemption were addressed as part of that final rule.

<sup>2670</sup> 84 FR 51310.

economy. NHTSA does not understand how 49 U.S.C. 32919 could be given effect if the purpose of the “other motor vehicle standards of the Government” provision is to compel their inclusion in NHTSA’s decision-making. NHTSA continues to disagree with the two district court cases suggesting that the “other motor vehicle standards of the Government” provision obviates 49 U.S.C. 32919, as explained at some length in the “One National Program” final rule preceding this regulatory action.<sup>2671</sup> NHTSA refers readers to that document for more detail on this topic.

With regard to State tailpipe standards that do not directly relate to fuel economy, NHTSA continues to believe that Congress’s original direction to consider “emissions standards applicable by reason of section 209(b) of [the CAA]” applied only to CAFE standards for MYs 1978-1980, as discussed in the NPRM. NHTSA agrees that the 1994 positive law recodification was not intended to make substantive changes to EPCA; the NPRM explained that, in dropping Section 502(d), Congress made clear that that provision was executed, *and that provision expressly directed NHTSA to consider State standards that had been granted preemption waivers under CAA 209(b)*. In order for States even to have their own emissions standards for motor vehicles, California must be granted a waiver of preemption under CAA section 209(b). If Congress had intended for NHTSA to continue to consider State tailpipe standards post-MY 1980, the direction to consider emissions standards that had been granted Section 209 waivers could have been placed elsewhere in the statute. Congress did not do so.<sup>2672</sup> While NHTSA may

---

<sup>2671</sup> See, e.g., 84 FR at 51323 (Sep. 27, 2019).

<sup>2672</sup> The negative inference canon is logically and reasonably employed here, particularly given that, as a factual matter and as discussed further below, considering EPA’s Tier 3 standards (which are clearly “other motor vehicle standards of the Government”) effectively accounts for the technological implications of California’s LEV VIII standards.

have considered State tailpipe standards in the past, it is not bound to do so, and NHTSA does not believe that it is unreasonable to consider those standards under technological feasibility or economic practicability *if* they are to be considered.

State tailpipe standards primarily affect fuel economy by requiring gasoline ICE vehicles to burn additional fuel when the engine first starts. For most gasoline engines on the road today, the majority of tailpipe NO<sub>x</sub>, NMOG, and CO emissions occur during “cold start,” before the three-way catalyst has reached the very high temperature (*e.g.*, 900-1000°F), at which point it is able to convert (through oxidation and reduction reactions) those emissions into less harmful derivatives. By strictly limiting the amount of those emissions, tailpipe smog standards require the catalyst to be brought to temperature extremely quickly, so modern vehicles employ cold start strategies that intentionally release fuel energy into the engine exhaust to heat the catalyst to the relevant temperature as quickly as possible. The additional fuel that must be used to heat the catalyst is typically referred to as a “cold-start penalty,” meaning that vehicle’s fuel economy (over a test cycle) is reduced because the fuel consumed to heat the catalyst did not go toward the goal of moving the vehicle forward.<sup>2673</sup> The Autonomie work employed to develop technology effectiveness estimates for this final rule does, in fact, account for cold-start penalties.<sup>2674</sup> The Autonomie model documentation discusses the fact that cold-start penalties were derived from an EPA database of MY 2016 vehicles, which would have met both EPA and California smog standards. Moreover, EPA regulations allow manufacturers to employ LEVIII data for Tier 3

---

<sup>2673</sup> For more information on this, *see, e.g.*, Pihl, Josh A., *et al.*, “Development of a Cold Start Fuel Penalty Metric for Evaluating the Impact of Fuel Composition Changes on SI Engine Emissions Control,” Oak Ridge National Laboratory, 2018. Available at <https://www.osti.gov/biblio/1462896-development-cold-start-fuel-penalty-metric-evaluating-impact-fuel-composition-changes-si-engine-emissions-control>.

<sup>2674</sup> *See* ANL Model Documentation, Section 6.1.5, available in Docket No. NHTSA-2018-0067.

compliance. Based on all of these factors, NHTSA believes that the negative fuel economy effects of California's tailpipe standards for smog-related emissions are reasonably represented in the analysis for the final rule, regardless of whether NHTSA was obligated by law to consider them expressly.

Ultimately, it would be illogical for NHTSA to consider legally unenforceable standards to be "other motor vehicle standards of the Government." That is the case for State standards preempted by EPCA. While NHTSA understands that certain commenters disagree with a separate final rule that NHTSA issued concerning EPCA preemption, and the particular State standards that NHTSA considers preempted by EPCA, those issues are outside the scope of this final rule.

(4) *The Need of the United States to Conserve Energy*

NHTSA has historically interpreted "the need of the United States to conserve energy" to mean "the consumer cost, national balance of payments, environmental, and foreign policy implications of our need for large quantities of petroleum, especially imported petroleum."<sup>2675</sup>

(a) *Consumer Costs and Fuel Prices:*

NHTSA explained in the NPRM that fuel for vehicles costs money for vehicle owners and operators. All else equal—a critical caveat—consumers benefit from vehicles that need less fuel to perform the same amount of work. Future fuel prices are a critical input into the economic analysis of potential CAFE standards because they determine the value of fuel savings

---

<sup>2675</sup> 42 FR 63184, 63188 (Dec. 15, 1977).

both to new vehicle buyers and to society, the amount of fuel economy that the new vehicle market is likely to demand in the absence of new standards, and they inform NHTSA about the “consumer cost...of our need for large quantities of petroleum.” In the proposal, NHTSA’s analysis relied on fuel price projections from the U.S. Energy Information Administration’s (EIA) Annual Energy Outlook (AEO) for 2017; in the final rule, on fuel price projections derived from the version of NEMS used to produce AEO 2019. Federal government agencies generally use EIA’s price projections in their assessment of future energy-related policies.

Several commenters stated that consumer costs for fuel were an important consideration. ACEEE stated that “The average U.S. household still spent nearly \$2,000 on gasoline and motor oil (directly) in 2017, making oil savings very relevant for consumers,” and argued that “Oil price volatility remains a threat to U.S. consumers and businesses—the price of crude oil has more than doubled since 2016, belying the theoretical suggestion in the notice that conditions for oil price shocks no longer exist,” suggesting that further fuel efficiency improvements were necessary to protect consumers.<sup>2676</sup> NESCAUM commented that prior analyses had suggested that consumers would save \$6,000 on net, after paying more for their vehicles upfront, and that the proposal would cost consumers more in fuel.<sup>2677</sup> Both NESCAUM and the States and Cities commenters stated that higher fuel costs would disproportionately affect low-income consumers, who spend a higher share of their income on fuel costs.<sup>2678</sup> The Congressional Tri-Caucus commented that “As we see oil prices rising again, it makes no sense for DOT to roll back these

---

<sup>2676</sup> ACEEE, NHTSA-2018-0067-12122, at 2.

<sup>2677</sup> NESCAUM, NHTSA-2018-0067-11691, at 4.

<sup>2678</sup> NESCAUM, NHTSA-2018-0067-11691, at 5; States and Cities, NHTSA-2018-0067-11735, at 75, citing Synapse Report.

standards.”<sup>2679</sup> The States and Cities commenters argued that increased gas expenditures would result “in negative economy-wide effects” for many years “given that cars sold in the model years for which NHTSA proposes to freeze standards will, according to the Agencies, be on the road for decades,” and stated that “NHTSA’s analysis is arbitrary and capricious because it entirely fails to consider how the Proposed Rollback would impact consumers and the economy as a whole due to increased gasoline expenditures.”<sup>2680</sup> The States and Cities commenters further argued that NHTSA was incorrect in the NPRM when it interpreted “the relevant question for the need of the U.S. to conserve energy is not whether there will be *any* movement in prices but whether that movement will be sudden and large,”<sup>2681</sup> and cited *State Farm* to say that NHTSA had “failed to consider an important aspect of the problem” by “failing to analyze the likely impact of even moderate future increases and volatility in fuel prices.”<sup>2682</sup>

A number of commenters addressed consumer willingness to pay more money upfront in order to save money on fuel costs. Many of these comments are addressed in Section VI.C as part of the discussion of how sales are modeled. More specifically in the context of how NHTSA interprets the need of the U.S. to conserve energy, IPI commented that NHTSA was incorrect that “consumers’ need to save money is now ‘less urgent’ and no longer supports a strong overall need to conserve energy. The agencies assert that past rulemakings were overly and paternalistically focused on ‘myopia.’ This statement ignores all the other pathways through which the 2012 standards benefit consumers’ need to save money, including by correcting informational asymmetries, attention costs, and other informational failures; positional

externalities; and various other supply-side and demand-side explanations for consumers' inability to achieve in an unregulated market the level of fuel economy that they desire. These components of the national need to conserve energy are discussed at length throughout these comments, and were specifically considered by the agencies in the 2012 rule.<sup>2683</sup>

Several commenters disagreed with NHTSA's suggestion in the NPRM that increasing U.S. production and exports reduced volatility in the oil market. Securing America's Energy Future stated that "...recent events are an important validation of public policies that support long-term goals like efficiency and fuel diversity. Indeed, in the absence of fuel-efficiency standards, global oil price volatility would likely render the country even more exposed to oil price shocks than it is currently."<sup>2684</sup> Mr. Bordoff, IPI, the States and Cities commenters, and UCS all commented that the oil market is global, so increasing U.S. production does not prevent price shocks that occur due to non-U.S. events or circumstances. Mr. Bordoff stated that "In a globalized oil market, the consequence of a supply disruption anywhere is a price increase everywhere—regardless of how much oil the U.S. imports."<sup>2685</sup> UCS made similar comments.<sup>2686</sup> Mr. Bordoff further commented that U.S. gasoline prices still follow the fluctuations in global crude oil prices regardless of the U.S. oil import/export balance,<sup>2687</sup> and stated that "Gasoline prices at the pump are especially sensitive to changes in the global crude oil price due to the relatively low level of fuel taxation [in the U.S.] compared to other OECD

<sup>2685</sup> Bordoff, EPA-HQ-OAR-2018-0283-3906, at 6.

<sup>2686</sup> UCS, NHTSA-2018-0067-12039, at 7.

<sup>2687</sup> IPI cited and echoed these comments. IPI, NHTSA\_2018-0067-12213, Appendix, at 3.

countries.”<sup>2688</sup> Mr. Bordoff stated that gas price spikes are still possible due to ongoing geopolitical challenges in major oil producing areas, and concluded that “Continuing with planned fuel economy increases through CAFE standards is one effective way to reduce the oil intensity of the economy and mitigate the adverse impact of future oil price increases on American drivers.”<sup>2689</sup> The States and Cities commenters cited to and echoed Mr. Bordoff’s comments on this point.<sup>2690</sup> CARB commented that the proposal had relied on AEO 2017, which reflected fuel prices that still assumed the augural standards remained in place, but that AEO 2018 assumes “no new fuel efficiency standard” and held fuel economy flat after 2021, and showed fuel prices would be higher.<sup>2691</sup>

Mr. Bordoff also commented that the future of shale oil in the U.S. was uncertain, and therefore increased U.S. oil production was not a basis on which to assume future global price stability.<sup>2692</sup> Mr. Bordoff argued that “Although shale oil is more responsive to price changes than conventional supply, it cannot serve as a swing supplier to stabilize oil markets in the way true spare capacity (held by Saudi Arabia) can. It takes at least 6-12 months for U.S. shale to respond to price changes.”<sup>2693</sup> Bordoff continued, stating that “For example, although shale oil is more responsive to oil prices, oil prices still plunged below \$30 per barrel at the start of 2016 and soared to \$80 per barrel earlier this year. Shale oil could not swing quickly enough to stabilize markets. This role fell to OPEC instead in both cases, first to put a floor under prices by cutting

<sup>2691</sup> CARB, NHTSA-2018-0067-11783, at 318.

<sup>2692</sup> Bordoff, EPA-HQ-OAR-2018-0283-3906, at 3.

<sup>2693</sup> *Id.*, at 7.

supply and, more recently, to provide relief by ramping up production.”<sup>2694</sup> Bordoff further commented that political or popular pressures due to environmental concerns may significantly increase the cost and/or difficulty of expanding shale infrastructure,<sup>2695</sup> and that even disregarding uncertainty in supply, ongoing uncertainty in demand (both U.S. and abroad) also contributed to global price uncertainty.<sup>2696</sup>

NHTSA agrees with commenters that consumer costs for fuel are relevant to the need of the U.S. to conserve energy. NHTSA also agrees that future fuel prices are uncertain, and that shale oil development in the U.S. is (1) still proceeding and subject to uncertainty, (2) very different from traditional sources like Saudi Arabia, and (3) not enough, by itself, to preclude any possibility of major swings in future global oil prices. That said, NHTSA continues to believe that U.S. shale development may reduce the negative price effects of global price swings due to events and situations outside of our borders. Shale represents a large, new, relatively-geopolitically-stable oil supply source, and traditional oil producers appear to understand that stabilizing prices below the price at which shale production starts to ramp up faster helps those traditional producers take market advantage of their lower cost of production.<sup>2697</sup> The net effect of this, for American drivers, should be greater fuel price stability, at least at the upper end of

---

<sup>2697</sup> Since 1995, EIA data indicates that OPEC production roughly stabilized in late 2016 and has either remained steady or fallen since then. *See* [https://www.eia.gov/opensdata/qb.php?category=1039874&sdid=STEO.PAPR\\_OPEC.M](https://www.eia.gov/opensdata/qb.php?category=1039874&sdid=STEO.PAPR_OPEC.M). *See also* Ilya Arkhipov, Will Kennedy, Olga Tanas, and Grant Smith, “Putin Dumps MBS to Start a War on America’s Shale Oil Industry,” March 7, 2020, Bloomberg News, *available at* <https://www.bloomberg.com/news/articles/2020-03-07/putin-dumps-mbs-to-start-a-war-on-america-s-shale-oil-industry> (describing the collapse of the OPEC+ coalition); EIA, “This Week in Petroleum – OPEC shift to maintain market share will result in global inventory increases and lower prices,” March 11, 2020, <https://www.eia.gov/petroleum/weekly/>; DOE, “DOE Responds to Recent Oil Market Activity,” March 9, 2020, <https://www.energy.gov/articles/doe-responds-recent-oil-market-activity>.

fuel prices. NHTSA also continues to believe that, for purposes of considering consumer cost of fuel as part of the need of the U.S. to conserve energy, the fact that Americans' gasoline costs might be minutely lower under more stringent CAFE standards and minutely higher under comparatively less stringent CAFE standards is not dispositive by itself. There is some tolerance in the market for some amount of fluctuation in fuel prices, as evidenced by the discussion in Section VI. Slow increases in fuel prices are relatively easy for households to absorb; sharp increases are more difficult.

Increases in CAFE stringency reduce the effects of all types of increases in fuel prices, at least to the extent that people can buy new cars and trucks, but as discussed below in Section VIII.B.4, fuel costs and per-vehicle costs balance against one another for many buyers. With respect to relatively low U.S. gasoline taxes creating more pass-through effects of global oil price fluctuations, that would be true regardless of stringency. Broadly speaking, while consumer fuel costs are an important consideration of the need of the U.S. to conserve energy, at this time NHTSA believes, as discussed in Section VI, that American consumers generally understand fuel costs and their tolerance for fluctuations, and tend to purchase vehicles accordingly. Requiring consumers to save more fuel over the longer term by spending more money upfront on new vehicle purchases may involve more tradeoffs than suggested in prior rulemakings, and this rulemaking seeks to keep these possible tradeoffs in mind.

*(b) National Balance of Payments:*

As the NPRM explained, the need of the United States to conserve energy has historically included consideration of the "national balance of payments" because of concerns that importing large amounts of oil created a significant wealth transfer to oil-exporting countries and left the

U.S. economically vulnerable.<sup>2698</sup> As recently as 2009, nearly half the U.S. trade deficit was driven by petroleum,<sup>2699</sup> yet this concern has largely laid fallow in more recent CAFE actions, arguably in part because other factors besides petroleum consumption have since played a bigger role in the U.S. trade deficit. Given recent significant increases in U.S. oil production and corresponding decreases in oil imports, this concern seems likely to remain fallow for the foreseeable future.<sup>2700</sup> Increasingly, changes in the price of fuel have come to represent transfers between domestic consumers of fuel and domestic producers of petroleum rather than gains or losses to foreign entities. NHTSA explained in the NPRM that some commenters have lately raised concerns about potential economic consequences for automaker and supplier operations in the U.S. due to disparities between CAFE standards at home and their counterpart fuel economy/efficiency and CO<sub>2</sub> standards abroad. NHTSA finds these concerns more relevant to technological feasibility and economic practicability than to the national balance of payments. Moreover, to the extent that an automaker decides to globalize a vehicle platform to meet more stringent standards in other countries, that automaker would comply with United States' standards and additionally generate overcompliance credits that it can save for future years if facing compliance concerns, or sell to other automakers. While CAFE standards are set at

---

<sup>2698</sup> See 42 FR 63184, 63192 (Dec. 15, 1977) (“A major reason for this need [to reduce petroleum consumption] is that the importation of large quantities of petroleum creates serious balance of payments and foreign policy problems. The United States currently spends approximately \$45 billion annually for imported petroleum. But for this large expenditure, the current large U.S. trade deficit would be a surplus.”).

<sup>2699</sup> See *Today in Energy: Recent improvements in petroleum trade balance mitigate U.S. trade deficit*, U.S. Energy Information Administration (July 21, 2014), <https://www.eia.gov/todayinenergy/detail.php?id=17191>.

<sup>2700</sup> For an illustration of recent increases in U.S. production, see, e.g., *U.S. crude oil and liquid fuels production, Short-Term Energy Outlook*, U.S. Energy Information Administration (June 2018), <https://www.eia.gov/outlooks/steo/images/fig13.png>. While it could be argued that reducing oil consumption frees up more domestically-produced oil for exports, and thereby raises U.S. GDP, that is neither the focus of the CAFE program nor consistent with Congress' original intent in EPCA. EIA's Annual Energy Outlook (AEO) series provides midterm forecasts of production, exports, and imports of petroleum products, and is available at <https://www.eia.gov/outlooks/aeo/>.

maximum feasible rates, efforts of manufacturers to exceed those standards are rewarded not only with additional credits but a market advantage in that those consumers who place a large weight on fuel savings will find such vehicles that much more attractive.

Several commenters addressed how much oil the U.S. imports, and the assumptions about imports in the NPRM analysis. Securing America’s Energy Future commented that “Because there are no readily available substitutes to oil in the U.S. transportation sector, volatile crude oil and petroleum product prices represent an enduring threat to the U.S. economy.”<sup>2701</sup> ACEEE commented that overall U.S. oil imports are higher now than they were in 1975, and nearly as high as they were in 2012, and also stated that compared to a small overall trade surplus in 1975, “the U.S. now runs a large overall trade deficit.”<sup>2702</sup> The States and Cities commenters made a similar point, arguing that the U.S. still imports large amounts of petroleum; that imports made up about 25 percent of total U.S. oil consumption in 2017; and that EIA indicates that “imports as a share of oil consumption in the United States are only about 10% lower today as compared to 1975, and we are producing the same amount of crude oil domestically today as we were in 1970.”<sup>2703</sup> IPI stated that EIA analysis shows that the “U.S. will continue to import crude oil through 2050 and ‘remains a net importer of petroleum and other liquids on an energy basis.’”<sup>2704</sup> CARB disagreed that the U.S. was projected to become a net petroleum exporter, and stated that even if it were, the rollback would have negative effects on the U.S., because (1) it ignores short-run damages caused by increased oil consumption and imports; (2) relies on

---

<sup>2701</sup> Securing America’s Energy Future, NHTSA-2018-0067-12172, at 6.

projections of net imports of oil which also do not take account of the effects of the proposed rule; and (3) is not supported by the evidence.<sup>2705</sup>

Regarding assumptions about oil imports in the NPRM analysis, the States and Cities commented that in 2016 the agencies had assumed that “90% of fuel savings from existing standards would lead directly to a reduction in imported oil,” and argued that the NPRM analysis had ignored that previous assumption and “la[id] great emphasis on the fact that ‘oil imports have declined while exports have increased’ since 2005.”<sup>2706</sup> IPI argued that the NPRM analysis was internally inconsistent, assuming in NHTSA’s need of the nation discussion that “additional gasoline consumption will be entirely domestic,” while “upstream emissions calculations assume that 95% of increased consumption will either be from foreign refining or from foreign crude imports,” and suggested that this inconsistency was purposeful to make the NPRM analysis look more favorable to the proposal.<sup>2707</sup> ACEEE commented that “The EIA AEO side cases suggest that reduced oil demand will primarily reduce oil imports, thus improving the overall balance of trade regardless of the narrow balance of trade in petroleum.”<sup>2708</sup>

Regarding the effects on the U.S. economy of increasing U.S. oil production, Mr. Morris agreed with the NPRM’s suggestion that U.S. self-sufficiency in petroleum supply meant that higher consumer payments for fuel under less-stringent CAFE standards would be transfers within the U.S. economy, and stated that “[a]t that point, the initial purpose of EPCA is entirely

---

<sup>2705</sup> CARB, NHTSA-2018-0067-11873, at 317.

<sup>2706</sup> States and Cities, NHTSA-2018-0067-11735, at 75.

<sup>2707</sup> IPI, NHTSA-2018-0067-12213, Appendix, at 3-4.

<sup>2708</sup> ACEEE, NHTSA-2018-0067-12122, at 2.

obviated.”<sup>2709</sup> The States and Cities commenters, in contrast, argued that focusing on this effect meant that NHTSA essentially claims that increasing revenues of oil companies—which report annual profits in the billions—is an even trade-off for adding cost pressures and oil-price shock exposure to American households.”<sup>2710</sup> The States and Cities commenters stated that “...this assertion ignores the negative economic impacts that would result from increasing the cost burden on oil consumers,” and was “...so implausible that it could not be ascribed to a difference of view or the product of agency expertise,” citing *State Farm*, 463 U.S. at 43.<sup>2711</sup>

As discussed above, NHTSA agrees that oil is a global commodity. Living in a globalized economy necessarily means that supply disruptions (and thus, price effects) can come from a great variety of sources—this was why the CAFE program was created, in recognition of this risk. Increasing U.S. energy independence reduces this risk. There are two ways to increase petroleum independence: to use less petroleum, and to produce more of our own petroleum and use less petroleum purchased from abroad. Both approaches work, and both are being followed today.

NHTSA also agrees that the Draft TAR text describes the analytical assumption that for every gallon of fuel not consumed as a result of more stringent standards, imported crude would be reduced by 0.9 gallons. The Draft TAR stated that this assumption was based on “changes in U.S. crude oil imports and net petroleum products in the AEO 2015 Reference Case in comparison [*sic*] the Low (i.e., Economic Growth) Demand Case,” and also on a 2013 paper by

<sup>2711</sup> *Id.*

Paul Leiby which “suggests that ‘Given a particular reduction in oil demand stemming from a policy or significant technology change, the fraction of oil use savings that shows up as reduced U.S. imports, rather than reduced U.S. supply, is actually quite close to 90 percent, and probably close to 95 percent.’”<sup>2712</sup>

EIA data clearly states that while the U.S. still relies on oil imports, it is producing an increasingly large share of the petroleum it consumes.<sup>2713</sup> In 2018, domestic petroleum production made up 86 percent of domestic consumption, while imports made up 11 percent. EIA data also clearly states that U.S. reliance on petroleum imports peaked in 2005 and has declined since then, and that the import-percentage-of-consumption in 2018 was the lowest it has been since 1957—this despite the fact that overall U.S. petroleum consumption has increased significantly over that time period as the on-road fleet has grown and VMT (both individual and collective) has increased. Of the 11 percent of oil consumed that was imported, 43 percent came from Canada, and 16 percent came from Persian Gulf countries. AEO 2019 states that under its Reference case assumptions, which it describes as a “best assessment” and “a reasonable baseline case,”<sup>2714</sup> the U.S. remains projected to become a net exporter of petroleum liquids by 2020.<sup>2715</sup> During several weeks in 2019, the U.S. also exported more oil than it imported.<sup>2716</sup>

U.S. Census data indicate that the U.S. balance of trade has generally grown over time, although it has fluctuated since peaking in 2006.<sup>2717</sup> U.S. Census data further indicate that the U.S. petroleum balance of trade, in particular, has fluctuated over time, peaking in 2008 at roughly -\$386 million and decreasing to -\$50 million in 2018. 2019 trends demonstrate further decreases. In percentage terms, petroleum trade as a percentage of total trade went from roughly 52 percent in 1992 (the earliest year for which Census appears to have data online), to 47 percent in 2008, to less than 6 percent in 2018. In terms of national balance of payments, this is fairly clear evidence that petroleum has decreased rapidly as part of the problem. Part of this is due to improvements in fleet fuel economy over time, and part is due to increases in U.S. production, particularly in the last several years.

NHTSA notes also that the Draft TAR previewed the possibility of this outcome, discussing the “Shale Oil Revolution” and the fact that “[t]he recent economics literature on whether oil shocks are the threat to economic stability that they once were is mixed.”<sup>2718</sup> The Draft TAR stated that because of increased U.S. shale oil production, “The resulting decrease in foreign imports...effectively permits U.S. supply to act as a buffer against artificial or other supply restrictions (the latter due to conflict or a natural disaster, for example).”<sup>2719</sup>

Since the Draft TAR was issued, U.S. shale production has developed even further, and U.S. petroleum imports have continued to fall. If more oil is being produced in the U.S., and more of domestic consumption comes from domestic production, then even though oil is a global

commodity and thus subject to price changes resulting from non-U.S. events, the U.S. economy is inherently better off. When money moves around within the U.S. instead of having to leave the U.S., and everyone's needs are being met, U.S. citizens are better off when things outside the U.S. go wrong—this is what NHTSA means when it refers to within-U.S. transfers not being a bad thing as compared to greater reliance on imports for consumption needs. To the extent that some commenters find within-U.S. transfers problematic because they increase U.S. oil company revenues without reducing fuel cost burdens on consumers, NHTSA notes that, as discussed above, consumers seem willing and able to tolerate some amount of fuel price increases and fluctuation risk, as evidenced by their purchasing decisions. Prices may still fluctuate, but shortages may foreseeably be reduced.

The Draft TAR stated that “despite continuing uncertainty about oil market behavior and outcomes and the sensitivity of the U.S. economy to oil shocks, it is generally agreed that it is beneficial to reduce petroleum fuel consumption from an energy security standpoint. It is not just imports alone, but both imports and consumption of petroleum from all sources and their role in economic activity, that may expose the U.S. to risk from price shocks in the world oil price. Reducing fuel consumption reduces the amount of domestic economic activity associated with a commodity whose price depends on volatile international markets.” NHTSA continues to agree with these statements, but cannot ignore the fact that increased U.S. petroleum production represents the other side of the coin. Again, both national balance of payments and energy security can be improved on both the supply side and the demand side. While today's final rule continues to improve on the demand side by setting standards that continue to push CAFE levels upward, it also recognizes that supply side improvements are playing a role.

(c) *Environmental Implications*

The NPRM explained that higher fleet fuel economy can reduce U.S. emissions of CO<sub>2</sub> as well as various other pollutants by reducing the amount of oil that is produced and refined for the U.S. vehicle fleet, but can also increase emissions by reducing the cost of driving, which can result in increased vehicle miles traveled (i.e., the rebound effect). Thus, the net effect of more stringent CAFE standards on emissions of each pollutant depends on the relative magnitudes of its reduced emissions in fuel refining and distribution and increases in its emissions from vehicle use. Fuel savings from CAFE standards also necessarily result in lower emissions of CO<sub>2</sub>, the main gas emitted as a result of refining, distribution, and use of transportation fuels. Reducing fuel consumption directly reduces CO<sub>2</sub> emissions because the primary source of transportation-related CO<sub>2</sub> emissions is fuel combustion in internal combustion engines.

NHTSA has considered environmental issues, both within the context of EPCA and the context of the National Environmental Policy Act (NEPA), in making decisions about the setting of standards since the earliest days of the CAFE program. As courts of appeal have noted in three decisions stretching over the last 20 years,<sup>2720</sup> NHTSA defined “the need of the United States to conserve energy” in the late 1970s as including, among other things, environmental implications. In 1988, NHTSA included climate change concepts in its CAFE notices and prepared its first environmental assessment addressing that subject.<sup>2721</sup> It cited concerns about climate change as one of its reasons for limiting the extent of its reduction of the CAFE standard

---

Cir. 1988) (noting that “NHTSA itself has interpreted the factors it must consider in setting CAFE standards as including environmental effects”); CBD, 538 F.3d 1172 (9<sup>th</sup> Cir. 2007).

<sup>2721</sup> 53 FR 33080, 33096 (Aug. 29, 1988).

for MY 1989 passenger cars.<sup>2722</sup> Since then, NHTSA has considered the effects of reducing tailpipe emissions of CO<sub>2</sub> in its fuel economy rulemakings pursuant to the need of the United States to conserve energy by reducing petroleum consumption.

Many commenters addressed the environmental implications of CAFE standards and the proposal. ACEEE stated that “The environmental need to save energy is much greater than we realized in 1975,” and that “The notice argues that since improved standards will not by themselves solve global warming, they are not necessary. That logic would equally suggest that since no one soldier would win a war, we should never deploy any troops. No one measure will solve global warming....vehicle standards have been the most important.”<sup>2723</sup> The Harvard environmental law clinic commenters similarly stated that “It is illogical to argue against taking a single step on the basis that a single step is insufficient to reach one’s goal,” and commented that it was unreasonable for the DEIS to state that “[t]he emission reductions necessary to keep global emissions within this carbon budget could not be achieved solely with drastic reductions in emissions from the U.S. passenger car and light truck fleet.”<sup>2724</sup> UCS also argued that with respect to the environmental implications of the standards, NHTSA’s “argument that the augural standards would only limit global warming by 0.02 degrees C in 2100 actually *supports* the need to maintain the standards. That a single U.S. policy could make that much difference in limiting global warming is, in fact, quite significant.”<sup>2725</sup>

<sup>2722</sup> 53 FR 39275, 39302 (Oct. 6, 1988).

<sup>2723</sup> ACEEE, NHTSA-2018-0067-12122, main comments, at 2.

<sup>2724</sup> Harvard environmental law clinic, EPA-HQ-OAR-2018-0283-5486, at 13.

<sup>2725</sup> UCS, NHTSA-2018-0067-12039, at 7.

The States and Cities commenters objected to NHTSA’s consideration in the NPRM of “whether rapid ongoing increases in CAFE stringency . . . can sufficiently address climate change to merit their costs,” arguing that NHTSA had “completely disregard[ed] environmental costs” contrary to NHTSA’s own long-standing approach to CAFE standards.<sup>2726</sup> The States and Cities commenters then framed the CO<sub>2</sub> impacts of the proposal in tons (specifically, 7,400 million metric tons additional CO<sub>2</sub> emitted by 2100 as compared to the augural standards) and argued that “the agency effectively ignores its own findings, in a sharp and unexplained break with the agency’s past practice of considering climate impacts,” citing *Fox Television*, 556 U.S. at 515 and the 2010 and 2012 final CAFE rules which discussed reduced economic damages from lower climate impacts for those standards compared to their baselines.<sup>2727</sup> IPI also argued that if NHTSA had focused on economic damages rather than fractions of degrees Celsius, “Once climate damages are fully monetized (as the agencies are required to do), it will become apparent that the proposed rollback will cause billions of dollars in climate damages. Billions of dollars lost to avoidable climate damages is not a small effect, and it very clearly is a ‘destructive and wasteful’ effect.”<sup>2728</sup> CARB also argued that the NPRM had “wholly fail[ed] to analyze the economic effects of the climate change and public health implications of the rollback,” stating that [t]he Agencies assert these are insignificant, but that is only because the Agencies’ projections of climate change are so extreme. An appropriate analysis of a proposal that speeds progress toward such a calamitous condition must acknowledge and analyze the expected effects.”<sup>2729</sup>

---

<sup>2726</sup> States and Cities, NHTSA-2018-0067-11735, at 73.

<sup>2727</sup> *Id.*

<sup>2728</sup> IPI, NHTSA-2018-0067-12213, Appendix, at 4-5.

<sup>2729</sup> CARB, NHTSA-2018-0067-11873, Detailed Comments, at 84.

The States and Cities commenters also argued that NHTSA had not explained what the NPRM’s definition of “conservation” as meaning “avoid[ing] wasteful or destructive use” “actually means and how it changes the agency’s past practice of considering environmental impacts,” citing *State Farm*, 463 U.S. at 43, and *Fox Television*, 556 U.S. at 515.<sup>2730</sup>

Regarding non-climate impacts, IPI commented that the NPRM “only briefly mention[ed] the possible effects on other emissions without detailing any of the myriad non-climate public health and welfare consequences from pollution associated with petroleum production and combustion for motor vehicles.”<sup>2731</sup> The States and Cities commenters similarly stated that “NHTSA’s evaluation of this factor fails to include any analysis of environmental costs related to air quality,” and that the NPRM/DEIS analysis substantially understates the actual impacts of the Proposed Rollback on criteria air pollutants (such as NOx and PM) and air toxics (such as benzene), making it inappropriate to rely upon.”<sup>2732</sup>

NHTSA agrees that the NPRM considered environmental implications of the standards somewhat differently from past rulemaking discussions. The 2012 final rule, for example, stated that “[t]he need of the nation to conserve energy has long operated to push the balancing toward more stringent standards,” and asked “[i]n this final rule, then, the question raised by this factor, combined with technological feasibility, becomes ‘how stringent can NHTSA set standards before economic practicability considerations intercede?’”<sup>2733</sup> The NPRM discussed the dictionary definition of “to conserve,” tentatively concluded that thousandths of a degree

<sup>2733</sup> 77 FR at 63038-39.

centigrade in 2100 did not rise to the level of being “wasteful,” and suggested that ultimately “we no longer view the need of the U.S. to conserve energy as nearly infinite.”<sup>2734</sup> This is an evolution in interpretation that was expressly acknowledged in the NPRM—the words “we no longer view” clearly indicate acknowledgement of a change in view, i.e., interpretation. The NPRM’s climate findings were not ignored, they were directly examined and discussed at 83 FR 43215-16 in the context of NHTSA’s interpretation of their significance. The NPRM also discussed overall costs and benefits and net benefits in the context of the proposed maximum feasible determination, and the cost of carbon emissions was included in those values. This final rule similarly directly examines and discusses the analytical findings below.

Moreover, contrary to commenters’ statements that NHTSA did not acknowledge that its interpretation of the effect of the “need of the U.S. to conserve energy” factor was changing, or that the balancing of factors was different, the NPRM directly stated that:

NHTSA well recognizes that the decision it proposes to make in today’s NPRM is different from the one made in the 2012 final rule that established standards for MY 2021 and identified ‘augural’ standard levels for MYs 2022-2025. Not only do we believe that the facts before us have changed, but we believe that those facts have changed sufficiently that the balancing of the EPCA factors and the other considerations must also change. The standards that we are proposing today reflect that balancing.<sup>2735</sup>

---

<sup>2734</sup> 83 FR at 43215-16.

<sup>2735</sup> 83 FR at 43213. *See also* 83 FR at 43226 (“In the 2012 final rule..., NHTSA stated that ‘maximum feasible standards would be represented by the mpg levels that we could require of the industry before we reach a tipping point that presents risk of seriously adverse economic consequences.’ [citation omitted] However, the context of that rulemaking was meaningfully different from the current context. At that time, NHTSA understood the need of the U.S. to conserve energy as necessarily pushing the agency toward setting stricter and stricter standards. Combining a then-paramount need of the U.S. to conserve energy with the perception that technological feasibility should no longer be seen as a limiting factor, NHTSA then concluded that only significant economic harm would be the basis for controlling the pace at which CAFE stringency increased over time. Today, the relative importance of the need of the U.S. to conserve energy has changed ... a great deal even since the 2012 rulemaking. [T]he need of the U.S. to conserve energy may no longer disproportionately outweigh other statutorily-mandated considerations such as economic practicability—even when considering fuel savings from potentially more-stringent standards.”).

NHTSA believes that this is clear acknowledgement of the differences in interpretation and the effect of those differences on policy decisions.

That said, NHTSA agrees (indeed, has always agreed) with commenters that environmental implications exist as a result of changes in CAFE stringency. While CO<sub>2</sub> emissions will be higher under this final rule than if NHTSA had determined that the augural standards were maximum feasible, they will be lower than they would have been under the proposal—for the “standard setting” runs, which are what NHTSA looks at for assistance in determining maximum feasible standards, NHTSA estimates that, accounting for both tailpipe and upstream emissions, CO<sub>2</sub> emissions in 2050 under the final standards will total 1,134 mmt, as compared to 1,149 mmt under the proposed standards, or 1,020 mmt under the augural standards. According to the Final EIS, which uses a “real-world” analysis that incorporates models and modeling approaches that permit the agency to take a hard look at the potential environmental impacts of the rule,<sup>2736</sup> NHTSA estimates that these amounts of CO<sub>2</sub> emissions would lead to the following global temperature, sea level, and ocean acidification effects<sup>2737</sup>:

---

<sup>2736</sup> See *Kleppe v. Sierra Club*, 427 U.S. 390, 410, n. 21 (1976).

<sup>2737</sup> As discussed in Section 5.3.1 of the FEIS, NHTSA used the Global Change Assessment Model (GCAM) Reference scenario to represent the No Action Alternative (Alternative 0) in the modeling runs used to create **Error! Reference source not found.** The GCAM Reference Scenario is based on a set of assumptions about drivers such as population, technology, and socioeconomic changes, in the absence of global action to mitigate climate change. It can be described as a “business-as-usual” scenario. NHTSA also conducted an analysis in Chapter 8 of the FEIS using the GCAM6.0 scenario, which assumes a moderate level of global GHG reductions and corresponds to stabilization, by 2100, of total radiative forcing and associated CO<sub>2</sub> concentrations at roughly 678 ppm. Several commenters argued that NHTSA presented climate results in the NPRM/DEIS in the context of a “doomsday scenario,” in which no actions at all are taken to mitigate carbon emissions, but NHTSA emphasizes that this is simply the GCAM Reference Scenario, which is a reasonable scenario to run given that GCAM is a widely accepted climate model. Running the analysis using the GCAM Reference Scenario and GCAM6.0 Scenario results in different absolute values for the climate variables presented in this table and Table 8.6.4-1 of the FEIS, but again, this is because of the underlying scenarios, which reflect very different levels of global action. When the differences in levels of global action are accounted for, the relative impact of each action alternative as compared to the No Action Alternative is very similar. Thus, regardless of what GCAM scenario the agencies consider regarding global

<sup>b</sup> The values for global mean surface temperature and sea-level rise are relative to the average of the years 1986 to 2005.

<sup>c</sup> Temperature changes reported as 0.000 are more than zero but less than 0.001.

<sup>d</sup> Sea-level rise changes reported as 0.00 are more than zero but less than 0.01.

<sup>e</sup> Ocean pH changes reported as 0.0000 are less than zero but more than -0.0001.

CO<sub>2</sub> = carbon dioxide; °C = degrees Celsius; ppm = parts per million; cm = centimeters

NHTSA understands that some commenters view climate change as an imminent existential threat. NHTSA does not agree, however, that Congress intended for NHTSA to set aside other statutory factors in determining what CAFE standards would be maximum feasible. Even the maximum feasible discussion for the 2012 final rule stated that

We recognize that higher standards would help the need of the nation to conserve more energy..., but based on our analysis and the evidence presented by the industry, we conclude that higher standards would not represent the proper balancing for MYs 2017-2025 cars and trucks. [footnote omitted] We conclude that the correct balancing recognizes economic practicability concerns as discussed above, and sets standards at the levels that the agency is promulgating in this final rule for MYs 2017-2021 and presenting for MYs 2022-2025.<sup>2738</sup>

The footnote following the last sentence quoted above further stated that “We underscore that the agency’s decision regarding what standards would be maximum feasible for MYs 2017-2025 is made with reference to the rulemaking time frame and the circumstances of this final rule. Each CAFE rulemaking (indeed, each stage of any given CAFE rulemaking) presents the agency with new information that may affect how the agencies we balance the relevant factors.”<sup>2739</sup> NHTSA has been consistent over time, despite commenters’ suggestions to the contrary, that maximum feasible is a balancing of factors; that all factors must be considered; and that information before the agency may change how the agency both understands and balances the statutory factors.

With regard to criteria and toxic air pollutant emissions, NHTSA agrees with commenters that the NPRM discussion of environmental implications did not specifically identify these emissions, but notes that air quality issues were discussed in a variety of places in the NPRM, DEIS, and PRIA, and that the monetized effects of air quality impacts were included in the

---

<sup>2738</sup> 77 FR at 63055.

<sup>2739</sup> *Id* at fn. 1275.

overall cost-benefit analysis which informed NHTSA's balancing of factors, as discussed above. To the extent that commenters disagreed with the values or the agency's air quality analyses, those topics will be addressed in Section VII and VIII and in the FEIS. NHTSA has considered all of these findings along with other factors, as discussed below.

*(d) Foreign Policy Implications*

In the NPRM, NHTSA explained that U.S. consumption and imports of petroleum products impose costs on the domestic economy that are not reflected in the market price for crude petroleum or in the prices paid by consumers for petroleum products such as gasoline. These costs include (1) higher prices for petroleum products resulting from the effect of U.S. oil demand on world oil prices, (2) the risk of disruptions to the U.S. economy caused by sudden increases in the global price of oil and its resulting impact of fuel prices faced by U.S. consumers, and (3) expenses for maintaining the strategic petroleum reserve (SPR) to provide a response option should a disruption in commercial oil supplies threaten the U.S. economy, to allow the U.S. to meet part of its International Energy Agency obligation to maintain emergency oil stocks, and to provide a national defense fuel reserve.<sup>2740</sup> Higher U.S. consumption of crude oil or refined petroleum products increases the magnitude of these external economic costs, thus increasing the true economic cost of supplying transportation fuels above the resource costs of

---

<sup>2740</sup> While the U.S. maintains a military presence in certain parts of the world to help secure global access to petroleum supplies, that is neither the primary nor the sole mission of U.S. forces overseas. Moreover, the scale of oil consumption reductions associated with CAFE standards would be insufficient to alter any existing military missions focused on ensuring the safe and expedient production and transportation of oil around the globe. Chapter 7 of the PRIA discussed this topic in more detail.

producing them. Conversely, *reducing* U.S. consumption of crude oil or refined petroleum products (by reducing motor fuel use) can reduce these external costs.

The NPRM stated that while these costs are considerations, the United States has significantly increased oil production capabilities in recent years to the extent that the U.S. is currently producing enough oil to satisfy nearly all of its energy needs and is projected to continue to do so or become a net energy exporter. This has added new stable supply to the global oil market and reduced the urgency of the U.S. to conserve energy. The NPRM referred readers to the balancing discussion for more detail on this issue.

Securing America’s Energy Future commented that continuing to raise stringency would be good for energy security, spur innovation, and “advance the administration’s energy dominance agenda.”<sup>2741</sup> CARB argued that the proposal would “significantly diminish U.S. energy security,” “...contrary to the President’s recent executive order to promote national security, and contrary to the intent of Congress in EPCA.”<sup>2742</sup>

Several commenters disagreed with the NPRM’s suggestion that increases in U.S. oil production reduced the foreign policy implications relevant to the need of the U.S. to conserve energy. ACEEE commented that because the market for oil is global, “...regardless of actual imports, the nation is still affected by what happens to oil worldwide, and oil remains a foreign policy concern....”<sup>2743</sup> Securing America’s Energy Future commented that increased U.S. production “...has reduced some of the negative consequences of oil dependence, energy

<sup>2743</sup> ACEEE, NHTSA-2018-0067-12122, main comments, at 2.

security is primarily a function of consumption, not production.”<sup>2744</sup> IPI argued that “...the agencies falsely and inconsistently argue that the need to conserve energy has diminished because U.S. reliance on foreign oil has decreased,” disagreeing with the NPRM’s assumption that monopsony and military security costs resulting from the proposal would be zero.<sup>2745</sup> The States and Cities commenters raised similar points, stating that “U.S. military and foreign policy institutes” place emphasis on “global oil market stability and the stability of major oil-exporting nations,” which the States and Cities argued had not changed as U.S. exports have risen.<sup>2746</sup> The States and Cities commenters further argued that if a quarter of U.S. oil consumed is still imported, then increases in consumption would necessarily raise imports, and thus also monopsony and military security costs associated with those imports.<sup>2747</sup>

CARB questioned whether it was accurate to assume that the U.S. would ever reach net exporter status, and commented that even if becoming a net exporter helped to insulate the Nation from the effects of reducing CAFE stringency, it would not lead to greater energy security until at least 2029, the first year for which AEO 2018 forecasts that the U.S. will stop being a net importer.<sup>2748</sup> CARB further argued that increased domestic oil production did *not* insulate the U.S. from risk, and that in fact “...current conditions are more prone to risk due to lower available spare oil production capacity in major oil producing countries, meaning that a

<sup>2747</sup> *Id.*

<sup>2748</sup> CARB, NHTSA-2018-0067-11783, at 317.

supply disruption is more likely to have a more pronounced effect on oil prices and U.S. energy security.”<sup>2749</sup>

Mr. Bordoff commented that geopolitical risk can still affect global oil prices, citing U.S. withdrawal from the Iran nuclear agreement and the reimposition of sanctions on Iranian oil sales; the collapse of Libyan oil production following conflict there; ongoing problems in Venezuela; a variety of short-term production outages in other producing areas; and even situations where geopolitics can result in lower prices rather than higher prices.<sup>2750</sup>

IPI stated that “...the *protective value* that the SPR offers given its size does automatically change as total U.S. petroleum consumption changes,” and argued that it was not sufficient to consider only “the budgetary costs for maintaining [the size of] the SPR.” IPI thus argued that “The agencies have failed to assess how much the relative protective value of the SPR will change as total U.S. consumption rises following the proposed rollback, and therefore have failed entirely to consider one important element of the national need to conserve energy.”<sup>2751</sup>

Total energy independence for any country is only possible if it does not participate in the global energy markets, either because it consumes no energy (which is unrealistic) or because it produces enough energy to meet all of its energy needs and uses only energy that is produced domestically. As discussed above, NHTSA agrees with commenters that the oil market is global, and that events and situations abroad can affect oil prices even as U.S. oil production increases.

---

<sup>2749</sup> *Id.*, at 319.

<sup>2750</sup> Bordoff, EPA-HQ-OAR-2018-0283-3906, at 3-4.

<sup>2751</sup> IPI, NHTSA-2018-0067-12213, Appendix, at 4.

The fact that the U.S. became a net oil exporter, at least on a weekly basis, in November 2019, and the evidence indicates that it will become a net oil exporter on a longer-term basis in MY 2020 does not change geopolitics in many parts of the world. Striving for energy independence in a global market necessarily means *reducing* risks, because even if the U.S. consumed only domestically-produced petroleum and continued to export, the U.S. economy would still be subject to oil price fluctuations due to external events and situations. The NPRM was clear on all of these points.<sup>2752</sup> The NPRM and PRIA repeatedly emphasized that changes in the oil market meant that the risk of damage to the U.S. economy and of additional pain for U.S. drivers is *lower* than it was at the beginning of the CAFE program, not that it was eliminated entirely. NHTSA agrees with commenters that risk still exists, and that both production and consumption of oil are relevant to how big that risk might be. NHTSA simply believes, as explained in the NPRM and as explained again below, that the risk is lower than it would have been in the absence of the rapid growth in U.S. oil production, and that the lower risk means that the need of the U.S. to conserve energy, from this perspective, is less dire than it was at earlier points in the program.

The analyses for both the NPRM and the final rule account for the ongoing economic risk of participating in the global oil market by placing a value on energy security. The energy security value is made of several components. While commenters are correct that neither the NPRM nor the final rule analyses attributed a positive cost to the monopsony or military security components, the agencies do employ a cost for macroeconomic shock risk as part of energy security. Section VI discusses these estimates in more detail; for purposes of this discussion,

---

<sup>2752</sup> See 83 FR at 43213-15.

NHTSA only notes that these issues are accounted for in the agencies' cost-benefit analysis, and to the extent that zero values are used for some elements, the reason for that is explained at length in those sections and public comments received on these issues did not present new information to change the agencies' minds on those values.

With regard to the comment that NHTSA should be accounting for the "protective value" of the SPR along with the literal cost of maintaining it, NHTSA is not in a position at this time to attempt to estimate such a value, and notes that the commenter provided no suggestions as to how to do so. The Department of Energy's website states that the maximum number of days of import protection provided by the SPR is 143 days, and that it takes 13 days from Presidential decision for SPR fuel to enter the market.<sup>2753</sup> The 1973 OPEC oil embargo lasted from October 1973 to March 1974, roughly 150 days. As explained, NHTSA continues to believe that the effect of increased U.S. oil production is to stabilize, broadly, global oil markets. The longer a sustained spike in prices due to geopolitical events continues, the greater incentive U.S. shale production has to respond. NHTSA believes that it is foreseeable that the SPR could be utilized to help mitigate a price shock in the interim, for the majority of foreseeable shock situations.

(5) *Factors that NHTSA is Prohibited From Considering*

The NPRM explained that EPCA also provides that in determining the level at which it should set CAFE standards for a particular model year, NHTSA may not consider the ability of manufacturers to take advantage of several EPCA provisions that facilitate compliance with

---

<sup>2753</sup> See <https://www.energy.gov/fe/services/petroleum-reserves/strategic-petroleum-reserve/spr-quick-facts-and-faqs>.

CAFE standards and thereby reduce the costs of compliance.<sup>2754</sup> As discussed further in Section IX below, NHTSA cannot consider compliance credits that manufacturers earn by exceeding the CAFE standards and then use to achieve compliance in years in which their measured average fuel economy falls below the standards. NHTSA also cannot consider the use of alternative fuels by dual fuel vehicles nor the availability of dedicated alternative fuel vehicles—including battery-electric vehicles—in any model year. EPCA encourages the production of alternative fuel vehicles by specifying that their fuel economy is to be determined using a special calculation procedure that results in those vehicles being assigned a higher equivalent fuel economy level than they actually achieve.

The NPRM further explained that the effect of the prohibitions against considering these statutory flexibilities in setting the CAFE standards is that the flexibilities remain voluntarily-employed measures. If NHTSA were instead to assume manufacturer use of those flexibilities in setting new standards, higher standards would appear less costly and therefore more feasible, which would thus effectively require manufacturers to use those flexibilities in order to meet higher standards. By keeping NHTSA from including them in our stringency determination, the provision ensures that these statutory credits remain true compliance flexibilities.

Additionally, for the non-statutory fuel economy improvement value program that NHTSA developed by regulation, the NPRM stated that NHTSA does not consider these subject to the EPCA prohibition on considering flexibilities. EPCA is very clear as to which flexibilities are not to be considered. When the agency has introduced additional flexibilities such as A/C

---

<sup>2754</sup> 49 U.S.C. 32902(h).

efficiency and “off-cycle” technology fuel economy improvement values, NHTSA has considered those technologies as available in the analysis. Thus, today’s analysis includes assumptions about manufacturers’ use of those technologies, as detailed in Section VI.

Michalek and Whitefoot commented that “[w]e find [the statutory prohibition on considering certain flexibilities in determining maximum feasible CAFE standards] problematic because the automakers use these flexibilities as a common means of complying with the regulation, and ignoring them will bias the cost-benefit analysis to overestimate costs.”<sup>2755</sup> IPI commented that “it is not clear that the statutory prohibition on considering credit availability was intended to apply to banked credits,” because 49 U.S.C. 32902(h)(3) was

added...as a ‘conforming amendment’ to EISA, which was the statute that gave NHTSA authority to allow credit trading and transferring; meanwhile, banking and borrowing have been part of NHTSA’s authority since EPCA in 1975. In 1989, e.g., NHTSA explicitly relied on the availability of ‘credit banks’ to justify maintaining the MY 1990 standard at 27.5 mpg instead of lowering its stringency. NHTSA has not explained why it now believes it may not more fully consider banking.<sup>2756</sup>

NHTSA agrees, as explained in the NPRM, that if the agency was able to consider the compliance flexibilities in determining maximum feasible standards, more-stringent standards would appear less costly and therefore more feasible. NHTSA is nevertheless bound by the statutory prohibition on considering the above-mentioned flexibilities. As for IPI’s disagreement that 32902(h)(3) should apply to banked credits because it was labeled a “conforming amendment,” NHTSA looks to the specific statutory language provided, which prohibits “[consideration], when prescribing a fuel economy standard, [of] the trading, transferring or

---

<sup>2755</sup> Michalek and Whitefoot, NHTSA-2018-0067-11903, at 10-11.

<sup>2756</sup> IPI, NHTSA-2018-0067-12213, Appendix, at 19.

*availability* of credits. . . .” (Emphasis added.) IPI’s suggested interpretation would render “availability” as surplusage. If Congress had meant the prohibition to apply only to traded and transferred credits, it would have said so. Instead, Congress also prohibited consideration of the “availability of credits,” which must be read reasonably to refer to “what credits are available,” i.e., banked credits. The fact that NHTSA considered the availability of banked credits in 1989, prior to establishment of this statutory prohibition, has no bearing in a post-EISA world.

Nonetheless, NHTSA notes that it is informed by the “real-world” analysis presented in the FRIA, which accounts for credit availability and usage, and manufacturers’ ability to employ alternative fueled vehicles—for purpose of conformance with E.O. 12866. Under the real-world analysis, compliance does, in fact, appear less costly. For example, today’s “real world” analysis shows manufacturers’ costs averaging about \$1,420 in MY 2029 under the final standards, as compared to the \$1,640 shown by the “standard setting” analysis. However, for purposes of determining maximum feasible CAFE levels, NHTSA considers only the “standard-setting” analysis shown in the NPRM, consistent with Congress’s direction.

*f) EPCA/EISA Requirements that No Longer Apply Post-2020*

The NPRM explained that Congress amended EPCA through EISA to add two requirements not yet discussed in this section relevant to determination of CAFE standards during the years between MY 2011 and MY 2020 but not beyond. First, Congress stated that, regardless of NHTSA’s determination of what levels of standards would be maximum feasible, standards must be set at levels high enough to ensure that the combined U.S. passenger car and light truck fleet achieves an average fuel economy level of not less than 35 mpg no later than

MY 2020.<sup>2757</sup> And second, between MYs 2011 and 2020, the standards must “increase ratably” in each model year.<sup>2758</sup> Neither of these requirements apply after MY 2020, so given that this rulemaking concerns the standards for MY 2021 and after, the NPRM stated that they are not relevant to this rulemaking.

CARB commented that because the proposal did not “provide for improved efficiency of motor vehicles” over the long term, “Stagnating the standards violates Congressional direction to ratably increase fuel economy when the technology for doing so has been demonstrated to exist (which it does...) or could be developed in the necessary time.”<sup>2759</sup>

NHTSA notes, again, that the statutory language is clear that Congress only directed ratable increases in stringency through MY 2020. After MY 2020, the statutory language is clear that standards simply need be “maximum feasible, as determined by the Secretary.” Some commenters may have disagreed that the proposal represented maximum feasible levels, but there is no statutory basis for arguing that the “ratable increase” requirement extends beyond MY 2020.

*g) Other Considerations in Determining Maximum Feasible Standards*

The NPRM explained that NHTSA has historically considered the potential for adverse safety consequences in setting CAFE standards. This practice has been consistently approved in case law. As courts have recognized, “NHTSA has always examined the safety consequences of

---

<sup>2757</sup> 49 U.S.C. 32902(b)(2)(A).

<sup>2758</sup> 49 U.S.C. 32902(b)(2)(C).

<sup>2759</sup> CARB, NHTSA-2018-0067-11873, Detailed Comments, at 84.

the CAFE standards in its overall consideration of relevant factors since its earliest rulemaking under the CAFE program.” *Competitive Enterprise Institute v. NHTSA*, 901 F.2d 107, 120 n. 11 (D.C. Cir. 1990) (“*CEI-I*”) (citing 42 Fed. Reg. 33534, 33551 (June 30, 1977)). The courts have consistently upheld NHTSA’s implementation of EPCA in this manner. *See, e.g., Competitive Enterprise Institute v. NHTSA*, 956 F.2d 321, 322 (D.C. Cir. 1992) (“*CEI-IP*”) (in determining the maximum feasible fuel economy standard, “NHTSA has always taken passenger safety into account”) (citing *CEI-I*, 901 F.2d at 120 n. 11); *Competitive Enterprise Institute v. NHTSA*, 45 F.3d 481, 482-83 (D.C. Cir. 1995) (“*CEI-III*”) (same); *Center for Biological Diversity v. NHTSA*, 538 F.3d 1172, 1203-04 (9<sup>th</sup> Cir. 2008) (upholding NHTSA’s analysis of vehicle safety issues associated with weight in connection with the MYs 2008-2011 light truck CAFE rulemaking). Thus, NHTSA explained that in evaluating what levels of stringency would result in maximum feasible standards, NHTSA assesses the potential safety impacts and considers them in balancing the statutory considerations and to determine the maximum feasible level of the standards.

The attribute-based standards that Congress requires NHTSA to set help to mitigate the negative safety effects of the historical single number standards originally required in EPCA, and in past rulemakings, NHTSA constrained its modeling so as not to consider possible mass reduction in lower weight vehicles in its analysis, which affected the resulting assessment of potential adverse safety impacts. That analytical approach did not reflect, however, the likelihood that automakers may pursue the most cost-effective means of improving fuel efficiency to comply with CAFE requirements. For the NPRM, as for the final rule, the modeling did not limit the amount of mass reduction that is applied to any segment, but rather considered that automakers may apply mass reduction based upon cost-effectiveness, similar to most other technologies. NHTSA does not, of course, mandate the use of any particular

technology by manufacturers in meeting the standards. The NPRM and today's final rule, like the Draft TAR, also considered the safety effect associated with the additional vehicle miles traveled due to the rebound effect.

NHTSA explained that the NPRM considered the safety effects of vehicle scrappage rates on the fleet as a whole. The NPRM also explained NHTSA's consideration of the effect of additional expenses in fuel savings technology on the affordability of vehicles—the likelihood that increased standards will result in consumers being priced out of the new vehicle market and choosing to keep their existing vehicle or purchase a used vehicle. Since new vehicles are significantly safer than used vehicles, slowing fleet turnover to newer vehicles results in older and less safe vehicles remaining on the roads longer. NHTSA stated that this significantly affects the safety of the United States light duty fleet, as described more fully in the safety section of the NPRM and in Chapter 11 of the PRIA. Furthermore, as fuel economy standards become more stringent, and more fuel efficient vehicles are introduced into the fleet, fueling costs are reduced. This results in consumers driving more miles, which results in more crashes and increased highway fatalities.

A number of commenters disagreed with a variety of aspects of the NPRM's analysis of safety, and several also disagreed with how NHTSA considered safety along with the other factors in the proposal. The States and Cities commenters, for example, agreed that "NHTSA has historically considered safety impacts when setting maximum feasible standards," but argued that:

in the Proposed Rollback, NHTSA departs from its past practice by relying on completely novel and unsupported theories regarding the linkages between fuel economy and safety that do not reflect reality. In the past, NHTSA has considered the safety of the technologies that improve fuel economy. [citations omitted] In the Proposed Rollback,

however, NHTSA has linked safety concerns with rebound and scrappage effects of more stringent fuel economy standards. [citations omitted] As discussed [elsewhere], these theories are unsupported, implausible, and contradicted by numerous experts—rendering them arbitrary and capricious. The agency has also failed to acknowledge or adequately justify its break with past analyses of safety. *See Fox Television*, 556 U.S. at 515.<sup>2760</sup>

EDF commented that NHTSA cannot “...lawfully rely upon the repercussions of increased driving as a justification.... The fact that the standards do not ‘compel’ this driving prevents such reliance, and...[EPCA/EISA] nowhere indicate that [NHTSA] can refuse to comply with [its] statutory obligations by pointing to a projection that individuals might drive more and in doing so, some of them will get into traffic accidents.<sup>2761</sup> EDF further argued that:

It is especially unlikely that Congress intended for NHTSA to consider potential increases in driving (or... ‘VMT’). Under basic economic theory and under the Agency’s traditional analysis (including their analysis of this proposal), an improvement in fuel economy—which makes driving cheaper—would be expected to lead to some increase in driving for households that are sensitive to and conscious of that effect on their budgets. Thus, consideration of VMT impacts could be used to undermine *any* fuel economy standard. Because VMT is ‘a factor [that] is both so indirectly related to [fuel economy] and so full of potential for canceling the conclusions drawn from [a fuel economy analysis] . . . it would surely have been expressly mentioned in [the statute] had Congress meant it to be considered.’ *Whitman v. Am. Trucking Associations*, 531 U.S. 457, 469 (2001).<sup>2762</sup>

Other comments on safety as part of the legal justification varied. NESCAUM claimed that NHTSA’s safety justification “is disputed by EPA’s technical staff based on their identification of flaws in NHTSA’s analysis,” suggesting that it was therefore invalid and not a basis for decision-making.<sup>2763</sup> Global commented that there was no policy reason for freezing the level of standards due to mass reduction concerns (i.e., safety), given footprint standards.<sup>2764</sup>

---

<sup>2760</sup> States and Cities, NHTSA-2018-0067-11735, at 77.

<sup>2761</sup> EDF, NHTSA-2018-0067-12137, Supplemental Safety Comments, at 3.

<sup>2762</sup> *Id.*

<sup>2763</sup> NESCAUM, NHTSA-2018-0067-11691, at 3.

<sup>2764</sup> Global, NHTSA-2018-0067-12032, Attachment A, at A-32.

IPI argued that it was inappropriate to account for vehicle safety-related deaths and injuries “without an adequate discussion of the health and safety impacts of the Proposed Rule’s increased emissions or without an accurate estimate of the actual safety impact of the rollback versus the 2012 standards.”<sup>2765</sup>

NHTSA agrees with commenters that the safety analysis conducted to inform this rulemaking (both NPRM and final rule) is different from—broader than—past safety analyses conducted to inform CAFE and CO<sub>2</sub> rulemakings. NHTSA disagrees, however, that the agency failed to acknowledge or explain this fact. The NPRM directly acknowledges and explains the evolution of the safety analysis over time and why, specifically, the NPRM included the safety effects of rebound and scrappage phenomena.<sup>2766</sup> The NPRM also expressly sought comment on these elements of the safety analysis and the safety analysis generally, before explaining how they worked and describing their tentative findings in considerable detail. It is inaccurate for commenters to claim that the agency did not acknowledge or explain these changes. Commenters’ disagreement with the substance of the safety analysis does not create a valid process complaint here. Section VI discusses in detail the comments received on the substance of the safety analysis, including a number of comments citing deliberative feedback provided by some members of EPA staff during NPRM development, and contains the agencies’ responses. With regard to the comment from EDF, as explained above, the premise that vehicles may be driven more or less in response to more or less stringent CAFE (or CO<sub>2</sub>) standards is called the rebound effect, and it is discussed at length in Section VI above. The rebound effect has been

---

<sup>2765</sup> IPI, NHTSA-2018-0067-12213, Appendix, at 11.

<sup>2766</sup> See 83 FR at 43106-07.

factored into rulemaking cost-benefit analyses and reduced CAFE and CO<sub>2</sub> standard benefits in such analyses for well over a decade,<sup>2767</sup> and EPA and NHTSA have written repeatedly about and considered the magnitude of this effect. NHTSA is aware that some commenters disagree that a rebound effect even exists for fuel economy, and understands how such commenters would correspondingly disagree that VMT-related safety effects could arise from differences in CAFE standards. But NHTSA does not agree that the rebound effect is zero, and correspondingly believes that safety effects from additional driving (due to exposure to crashes) exist and are capable of quantification for analytical purposes.

Moreover, if EDF were correct that agencies may consider only the behavior that regulations directly “compel,” then CAFE analysis would be challenged to consider even fuel savings—the purpose of CAFE standards—because the standards do not compel Americans to drive, or to buy new vehicles, or to buy any vehicles at all. Reasonable assumptions about how much Americans drive (depending on how much it costs to drive, among other things), and what vehicles Americans buy and how often they buy them (depending on how much those vehicles cost, among other things), are useful and important for including in analyses that help decision-makers distinguish between different levels of potential CAFE standards. Circular A-4 additionally directs agencies to consider ancillary effects of rulemakings.<sup>2768</sup> NHTSA believes

---

<sup>2767</sup> See, e.g., 68 FR 16868, 16878 (Apr. 7, 2003).

<sup>2768</sup> See OIRA, “Regulatory Impact Analysis: A Primer,” at 7, [https://www.reginfo.gov/public/jsp/Utilities/circular-a-4\\_regulatory-impact-analysis-a-primer.pdf](https://www.reginfo.gov/public/jsp/Utilities/circular-a-4_regulatory-impact-analysis-a-primer.pdf) (“In addition to the direct benefits and costs of each alternative, the list should include any important ancillary benefits and countervailing risks. An ancillary benefit is a favorable impact of the alternative under consideration that is typically unrelated or secondary to the purpose of the action (e.g., reduced refinery emissions due to more stringent fuel economy standards for light trucks). A countervailing risk is an adverse economic, health, safety, or environmental consequence that results from a regulatory action and is not already accounted for in the direct cost of the action (e.g., adverse safety impacts from more stringent fuel-economy standards for light trucks). As with other benefits and costs, an effort should be made to quantify and monetize both ancillary benefits and countervailing risks.”)

that it is reasonable to consider these effects as part of the safety analysis, and to consider safety effects as part of its determination of maximum feasible standards.

## 2. Administrative Procedure Act

To be upheld under the “arbitrary and capricious” standard of judicial review in the APA, an agency rule must be rational, based on consideration of the relevant factors, and within the scope of the authority delegated to the agency by the statute. The agency must examine the relevant data and articulate a satisfactory explanation for its action including a “rational connection between the facts found and the choice made.”<sup>2769</sup>

Statutory interpretations included in an agency’s rule are subject to the two-step analysis of *Chevron, U.S.A. v. Natural Resources Defense Council*.<sup>2770</sup> Under step one, where a statute “has directly spoken to the precise question at issue,” *id.* at 842, the court and the agency “must give effect to the unambiguously expressed intent of Congress.”<sup>2771</sup> If the statute is silent or ambiguous regarding the specific question, the court proceeds to step two and asks “whether the agency’s answer is based on a permissible construction of the statute.”<sup>2772</sup>

If an agency’s interpretation differs from the one that it has previously adopted, the agency need not demonstrate that the prior position was wrong or even less desirable. Rather, the agency would need only to demonstrate that its *new* position is consistent with the statute and supported by the record and acknowledge that this is a departure from past positions. The

---

<sup>2769</sup> *Burlington Truck Lines, Inc., v. United States*, 371 U.S. 156, 168 (1962).

<sup>2770</sup> 467 U.S. 837 (1984).

<sup>2771</sup> *Id.* at 843.

<sup>2772</sup> *Id.*

Supreme Court emphasized this in *FCC v. Fox Television*.<sup>2773</sup> When an agency changes course from earlier regulations, “the requirement that an agency provide a reasoned explanation for its action would ordinarily demand that it display awareness that it *is* changing position,” but “need not demonstrate to a court’s satisfaction that the reasons for the new policy are *better* than the reasons for the old one; it suffices that the new policy is permissible under the statute, that there are good reasons for it, and that the agency *believes* it to be better, which the conscious change of course adequately indicates.”<sup>2774</sup> The APA also requires that agencies provide notice and comment to the public when proposing regulations,<sup>2775</sup> as the agencies did when publishing the NPRM for this rulemaking.

a) *Requests to Extend the Comment Period*

On August 2, 2018, the agencies published the NPRM on the agencies’ respective websites, soliciting public comments.<sup>2776</sup> On August 24, 2018, the *Federal Register* published the NPRM, which began a 60-day public comment period.<sup>2777</sup> The public comment period would have ended on October 23, 2018, but the agencies extended the comment period until October 26, 2018.<sup>2778</sup> In the *Federal Register* notice extending the comment period, the agencies explained that they were denying requests for an extension of the comment period by at least 60 days, explaining that “[a]utomakers will need maximum lead time to respond to the final

---

<sup>2773</sup> 556 U.S. 502 (2009).

<sup>2787</sup> *See, e.g.*, comments from the Alliance of Automobile Manufacturers, Docket No. NHTSA-2018-0067-3619; Communities for a Better Environment, Docket No. EPA-HQ-OAR-2018-0283-1095; Consumer Federation of America, NHTSA-2018-0067-3400; Edison Electric Institute, received by mail; and South Coast Air Quality Management District, Docket No. EPA-HQ-OAR-2018-0283-0885.

requested a 60-day extension, stressing the complexity of the issues and the significance of the proposed rule’s impact on the environment.<sup>2788</sup> The American Lung Association also requested a 60-day extension of the comment period, asserting that it needed more time to analyze the impact of the proposed rule on human health.<sup>2789</sup> The California Air Resources Board (CARB) likewise requested a 60-day extension, in part, based on information that it asserted should have been included in the NPRM.<sup>2790</sup> New York University School of Law’s Institute for Policy Integrity similarly requested a 60-day extension based on information that it contended should have been included in the NPRM’s “sensitivity analysis table for the ‘Cumulative Changes in Fleet Size, Travel (VMT), Fatalities, Fuel Consumption and CO2 Emissions through MY2029.’”<sup>2791</sup>

The agencies do not believe a further extension of the comment period was warranted under the circumstances.<sup>2792</sup> The APA does not specify a minimum number of days for a comment period.<sup>2793</sup> Two Executive Orders also provide direction to Federal agencies with respect to the length of a comment period for a proposed rule.<sup>2794</sup> Executive Order 12,866 states that “[e]ach agency shall (consistent with its own rules, regulations, or procedures) provide the public with meaningful participation in the regulatory process . . . . In addition, each agency

<sup>2788</sup> See, e.g., comments from the Environmental Law and Policy Center, NHTSA-2018-0067-2728; Georgetown Climate Center, Docket No. NHTSA-2018-0067-3610; Center for Biological Diversity, Conservation Law Foundation, Earthjustice, Environmental Defense Fund, Natural Resources Defense Council, Public Citizen, Sierra Club, and Union of Concerned Scientists, Docket No. NHTSA-2018-0067-3278; and National Governors Association, Docket No. EPA-HQ-OAR-2018-0283-0871.

<sup>2789</sup> See comments from American Lung Association, Docket No. NHTSA-2018-0067-3615.

<sup>2790</sup> See comments from California Air Resources Board, Docket No. NHTSA-2018-0067-4166.

<sup>2791</sup> See comments from New York University School of Law’s Institute for Policy Integrity, NHTSA-2018-0067-5641.

<sup>2792</sup> See 83 FR 48578 (Sept. 26, 2018) (extending comment period until October 26, 2018 and denying requests for longer extensions).

<sup>2793</sup> See 5 U.S.C. 553(c).

<sup>2794</sup> The Executive Orders do not create any enforceable right or benefit by a party against any federal agency. E.O. 12,866 § 10; E.O. 13,563 § 7(d).

should afford the public a meaningful opportunity to comment on any proposed regulation, which in most cases should include a comment period of not less than 60 days.”<sup>2795</sup>

Additionally, Executive Order 13,563 reaffirmed Executive Order 12,866’s directive that comment periods should generally not be less than 60 days, stating: “To the extent feasible and permitted by law, each agency shall afford the public a meaningful opportunity to comment through the Internet on any proposed regulation, with a comment period that should generally be at least 60 days.”<sup>2796</sup> More recently, in December of 2018, the Department of Transportation implemented DOT Order 2100.6, which provides its operating administrations, including NHTSA, with direction on appropriate rulemaking processes and procedures.<sup>2797</sup> While not yet effective at the time the proposal was published, the Order provides that “the comment period for significant DOT rules should be at least 45 days.”<sup>2798</sup> The 63 day comment period for the proposal far exceeded this amount.

Consistent with these principles, courts give broad discretion to agencies in determining the reasonableness of a comment period. Courts have frequently upheld comment periods that were significantly less than the 63-day comment period here. *See Connecticut Light & Power Co. v. Nuclear Regulatory Comm'n*, 673 F.2d 525, 534 (D.C. Cir. 1982) (upholding a 30-day comment period and stating that “neither statute nor regulation mandates that the agency do more”); *see also North American Van Lines v. ICC*, 666 F.2d 1087, 1092 (7th Cir. 1981)

<sup>2795</sup> Executive Order 12,866 § 6(a)(1).

<sup>2796</sup> Executive Order 13,563 § 2(b).

<sup>2797</sup> DOT Order 2100.6, "Policies and Procedures for Rulemakings," available at: <https://www.transportation.gov/sites/dot.gov/files/docs/regulations/328561/dot-order-21006-rulemaking-process-signed-122018.pdf>.

<sup>2798</sup> *Id.*, at (11)(i)(3).

(upholding a 45-day comment period).<sup>2799</sup> In addition to the length of a comment period, courts consider the number of comments received and whether comments had an effect on an agency's final rule, in assessing whether the public had a meaningful opportunity to comment.<sup>2800</sup>

These principles are easily satisfied here. Here, the agencies initially provided a 60-day comment period and then further extended it to ensure compliance with the Clean Air Act. The Clean Air Act requires that the record of proceedings allowing oral presentation of data, views, and arguments on a proposed rule be kept open for 30 days after completion of a proceeding to provide an opportunity for submission of rebuttal and supplementary information.<sup>2801</sup> Because the final "proceeding allowing oral presentation of data, views, and arguments" was expected to be on September 26, 2018, the comment period for the proposed rule was extended by three days to meet that requirement.<sup>2802</sup>

The 63-day comment period was consistent with what the law requires.<sup>2803</sup> While the agencies understand and agree with commenters about the importance and complexity of the issues here, the public docket demonstrates that the public had a meaningful opportunity to comment on the proposed rule.<sup>2804</sup> The agencies received a total of more than 750,000 public

---

<sup>2799</sup> In certain circumstances, particularly urgent ones, courts have even upheld comment periods of less than 30 days. *See* *Omnipoint Corp. v. FCC*, 78 F.3d 620, 629–30 (D.C. Cir. 1996) (holding that a 14-day comment period was sufficient given the "urgent necessity for rapid administrative action under the circumstances"); *see also* *Fla. Power & Light Co. v. United States*, 846 F.2d 765, 772 (D.C. Cir. 1988) (upholding a 15-day comment period given a deadline that Congress imposed on the Nuclear Regulatory Commission to finalize its rule).

<sup>2800</sup> *See* *Florida Power & Light, Co. v. United States*, 846 F.2d 765, 772 (D.C. Cir. 1988); *see also* *Conference of State Bank Sup'rs v. Office of Thrift Supervision*, 792 F. Supp. 837, 844 (D.D.C. 1992).

<sup>2801</sup> 42 U.S.C. 7607(d)(5).

<sup>2802</sup> *See* 83 FR 48578, 48581 (Sept. 26, 2018).

<sup>2803</sup> In any event, the two Executive Orders explicitly state that they do not create any enforceable right or benefit by a party against any federal agency. *See* Executive Order 12,866 § 10; *see also* Executive Order 13,563 § 7(d).

<sup>2804</sup> *See* *Rural Cellular Ass'n v. FCC*, 588 F.3d 1095, 1101 (D.C. Cir. 2009).

comments, many of which commented on detailed, technical portions of the proposed rule. For instance, the California Air Resources Board provided 415 pages of detailed comments involving very specific aspects of the proposal,<sup>2805</sup> and the Auto Alliance filed 202 pages of detailed comments, and commissioned a separate econometric study analyzing the effects of multiple alternatives.<sup>2806</sup> This is clear evidence that the public had not only the opportunity to review and comment on the proposal, but to do so with an extraordinary level of detail.

Finally, notwithstanding the sufficiency of the agencies' 63-day comment period, the agencies published their NPRM on their websites on August 2, 2018, more than three weeks before the comment period formally opened on August 24, and this effectively provided the public with 22 additional days in which to review the proposal and draft comments.<sup>2807</sup>

*b) Other Comments on Public Participation*

Several commenters objected to NHTSA's 15-page limit on primary comments, asserting that it impacted the public's ability to meaningfully participate in the rulemaking process.<sup>2808</sup> However, as certain of the commenters acknowledged, the NPRM also explicitly stated that commenters could also submit attachments—without any page limit.<sup>2809</sup> Thus, the page limit on primary comments did not prevent commenters from presenting any information they deemed

---

<sup>2805</sup> NHTSA-2018-0067-11873.

<sup>2806</sup> NHTSA-2018-0067-12073.

<sup>2807</sup> The agencies' public dockets also remained open for more than one year after the start of the comment period, and the agencies considered some late comments received, to the extent practicable, although many late comments were simply too untimely to be considered.

<sup>2808</sup> See States of California et al., Attachment1\_States and Cities Detailed Comments, Docket No. NHTSA-2018-0067-11735, at 46; Center for Biological Diversity, et al., NHTSA-2018-0067-12088; CARB, NHTSA-2018-0067-1187; Environmental Defense Fund, NHTSA-2018-0067-12108; BlueGreen Alliance, NHTSA-2018-0067-12440; Connecticut Department of Energy and Environmental Protection (DEEP), EPA-HQ-OAR-2018-0283-4202.

<sup>2809</sup> 83 FR 43470 (Aug. 24, 2018) (citing 49 CFR 553.21).

relevant to the agencies. Both primary comments and their attachments are available in the agencies' public docket, and were considered by the agencies in this rulemaking as demonstrated by the responses to comments discussed throughout this final rule.

NHTSA's 15-page limit simply prescribed the form that comments should take: a concise summary comment of up to 15 pages, with optional attachments with no page limit. Many commenters submitted extensive attachments to their comments, including commenters that objected to the 15-page limit for primary comments. For example, several States and cities that jointly commented submitted a 13-page primary comment, accompanied by 145 pages of "detailed comments" and three appendices totaling 101 additional pages.<sup>2810</sup> The 15-page limit had the effect of creating executive summaries of otherwise voluminous comments, which increased efficiency during the rulemaking process. This was NHTSA's stated purpose for the 15-page limit. As explained in the NPRM: "NHTSA established this limit to encourage you to write your primary comments in a concise fashion."<sup>2811</sup> In any event, no commenter was prevented from submitting information to the agencies based on NHTSA's page limitation for primary comments. The agencies strongly disagree that public participation was impeded by NHTSA's specification that primary comments were limited to 15 pages.

On August 2, 2018, the agencies published a joint Notice of Proposed Rulemaking (NPRM) on the agencies' respective websites, which solicited public comments on "The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021–2026 Passenger Cars

---

<sup>2810</sup> States of California et al., NHTSA-2018-0067-11735.

<sup>2811</sup> 83 FR 43470 (Aug. 24, 2018).

and Light Trucks.”<sup>2812</sup> The NPRM indicated that the public may submit written comments by any of the following methods: online through the Federal eRulemaking Portal at [www.regulations.gov](http://www.regulations.gov), by fax, by mail, or by hand delivery. The NPRM also notified the public that the agencies planned to hold three joint public hearings, and would accept oral and written comments at the hearings. The NPRM indicated that the agencies planned to hold the hearings in Washington, D.C.; the Detroit, Michigan area; and the Los Angeles, California area, but indicated that the specific addresses and dates for the hearings would be announced in a supplemental *Federal Register* notice.<sup>2813</sup> On August 24, 2018, the agencies published a notice in the *Federal Register*, which provided new locations for two of the three hearings and added dates for each hearing.<sup>2814</sup> That notice informed the public that the agencies planned to hold three joint public hearings during the comment period: 1) on September 24, 2018 in Fresno, California; 2) on September 25, 2018 in Dearborn, Michigan; and 3) on September 26, 2018 in Pittsburgh, Pennsylvania.<sup>2815</sup>

The agencies also received several comments with respect to the sufficiency of the agencies’ public hearings during the comment period. For example, the South Coast Air Quality Management District asserted that EPA failed to meet its obligation to hold public hearings under the Clean Air Act, claiming that an EPA “political appointee” did not have the legal

---

<sup>2812</sup> <https://www.nhtsa.gov/corporate-average-fuel-economy/safe>; <https://www.epa.gov/newsreleases/us-epa-and-dot-propose-fuel-economy-standards-my-2021-2026-vehicles>. The Agencies subsequently published the NPRM in the *Federal Register* on August 24, 2018. 83 FR 42986 (August 24, 2018).

<sup>2813</sup> 83 FR 42986 (August 24, 2018).

<sup>2814</sup> 83 FR 42817 (August 24, 2018).

<sup>2815</sup> *Id.*

authority to change hearing locations.<sup>2816</sup> The comment also claimed that holding certain of the hearings in smaller metropolitan areas than originally announced resulted in 15 million fewer potential participants in the hearings.<sup>2817</sup> Additionally, the comment noted that the NPRM and the notice that set the new locations of two of the public hearings were both published in the Federal Register on the same day, yet those documents contained conflicting hearing locations (the NPRM listed the originally planned hearing locations).<sup>2818</sup>

Similarly, seventeen States and the District of Columbia submitted a joint comment requesting that the agencies reinstate the hearing locations that were initially listed in the NPRM, with the stated goal of maximizing the number of public participants.<sup>2819</sup> Similarly, a group of environmental organizations jointly submitted a comment stating that the new hearing locations failed to maximize the potential participants for the agencies' public hearings.<sup>2820</sup> That group also asserted that the agencies failed to provide a reason for the agencies' denial of requests to hold more than three public hearings.<sup>2821</sup>

A number of other commenters also requested that the Agencies hold additional public hearings. See, e.g., comments from the Georgetown Climate Center, 20180906 - GCC Comments to NHTSA and EPA, Docket No. NHTSA-2018-0067-3610; The City of Los Angeles, Docket No. NHTSA-2018-0067-4159, at 2-3; California Air Resources Board, 2018-09-11 SAFE Rule DEIS – CARB Req Add Info, Docket No. NHTSA-2018-0067-4166, at 1; Northeast States for Coordinated Air Use Management, NESCAUM SAFE rule request for comment extension and hearing\_20180824, Docket No. NHTSA-2018-0067-2158, at 1-2.

<sup>2821</sup> *Id.*

The agencies more than satisfied their legal obligation with respect to holding public hearings, and the three hearings provided substantial additional opportunity for public participation. While the agencies understand that some commenters were disappointed with some aspects of the process, those commenters did not demonstrate that the agencies' process was legally deficient, nor that any party suffered prejudice from the changes the agencies made to their public hearing arrangement.

The APA does not require agencies to hold public hearings during the rulemaking process, unless the opportunity for a public hearing is required by a governing statute.<sup>2822</sup> NHTSA's governing fuel economy statute does not require a public hearing during the rulemaking process.<sup>2823</sup> The Clean Air Act requires EPA to "give interested persons an opportunity for the oral presentation of data, views, or arguments, in addition to an opportunity to make written submissions . . . ." 42 U.S.C. 7607(d)(5)(ii). The agencies' three joint public hearings satisfied this statutory requirement.

The agencies note that it was clear from the NPRM that the hearings were not yet finalized. No addresses or dates were announced for the hearings, and the NPRM indicated that information on the hearings would be forthcoming in a supplemental *Federal Register* notice. The NPRM (signed by the EPA Administrator) indicated that three hearings would be held, and the fact that specific details about those hearings were announced in a later notice signed by a different political appointee does not itself make the hearings themselves invalid. The Clean Air

---

<sup>2822</sup> See 5 U.S.C. 553(c). Absent a statutory requirement, the APA gives agencies the discretion whether or not to hold a public hearing, stating that "the agency shall give interested persons an opportunity to participate in the rule making through submission of written data, views, or arguments with or without opportunity for oral presentation." *Id.*

<sup>2823</sup> See 49 U.S.C. 32902.

Act does not mandate hearings in any particular location and the public was aware from the NPRM that additional information on the hearings would be forthcoming. To the extent that any individual person or group was inconvenienced by the change in location announced in the supplemental notice, they still had ample time to submit public comments through any of the multiple other available methods indicated in the NPRM.<sup>2824</sup>

The agencies regret any confusion that resulted from publication of the NPRM in the *Federal Register* on the same date as publication of the notice that updated the hearing locations and provided additional information, including hearing dates. However, because the NPRM did not include dates for the hearings, and the NPRM informed interested parties to look for an additional notice that would announce specific dates and addresses for the hearings, no one could have relied on the NPRM to the exclusion of the supplemental notice.<sup>2825</sup>

The agencies ultimately held three public hearings, as was originally announced. There is no Clean Air Act requirement for a particular number of hearings, and by holding the hearings in locations throughout the United States (including in California), the agencies offered a meaningful opportunity for participation. Moreover, the public docket remained open for two months subsequent to the announcement of the final hearing locations, providing any interested party who was unable to attend a public hearing ample opportunity to submit comments in

---

<sup>2824</sup> Executive Order 13,563 offers guidance to agencies with respect to how to maximize public participation. The Executive Order states that agencies should “afford the public a meaningful opportunity to comment through the Internet on any proposed regulation . . . .” The vast majority of the comments the agencies received in this rulemaking were submitted through the internet.

<sup>2825</sup> Additionally, as a matter of fairness, the agencies gave interested parties notice about the change in public hearing locations one month prior to the first public hearing. *See* 83 FR 42817 (August 24, 2018).

writing. As evidence of this meaningful opportunity to comment on the proposed rule, the agencies received a total of more than 750,000 public comments.

Several commenters also asserted that the agencies delayed posting the hearing transcripts to the public docket until October 25, which was one day before the close of the public comment period.<sup>2826</sup> The Environmental Defense Fund claimed that this was inconsistent with the Clean Air Act's requirements that "[t]he transcript of public hearings, if any, on the proposed rule shall also be included in the docket promptly upon receipt from the person who transcribed such hearings." 42 U.S.C. 7607(d)(4)(B).<sup>2827</sup> As one commenter acknowledged, the transcripts were certified by the reporters on September 26, 2018 (Pittsburgh hearing), September 27, 2018 (Dearborn hearing), and October 1, 2018 (Fresno hearing).<sup>2828</sup> The agencies made the transcripts publicly available within a reasonable period. Moreover, it was reasonable for the agencies to have an opportunity to review the transcripts for errors prior to making them publicly available. While the concern expressed by these commenters was an inadequate ability to offer responsive comments to the transcripts, the rulemaking process would be never-ending if every commenter had an opportunity to respond to every other commenter. There is no such requirement in the APA, the Clean Air Act, or otherwise. The public had sufficient opportunity to comment on the agencies' proposals, as described above.

<sup>2827</sup> Environmental Defense Fund, NHTSA-2018-0067-12371.

<sup>2828</sup> State of California et al., NHTSA-2018-0067-11735.

A few commenters requested that the agencies host a workshop or webinar to help commenters better understand the agencies' modeling and analyses.<sup>2829</sup> The commenters pointed to similar activities undertaken by EPA for other complex rulemakings. While the agencies did not conduct a live workshop or webinar regarding the proposal, they did make extensive information publicly available beyond the contents of the NPRM. To assist the public, NHTSA hosted a dedicated webpage with information on the modeling.<sup>2830</sup> The webpage included a video introduction to the CAFE model.<sup>2831</sup> The webpage enabled members of the public to download the model software, its system documentation, source code, and input files.<sup>2832</sup> Many commenters commented in detail on the modeling and analyses. However, the agencies recognize that public stakeholders vary in their experience and understanding of the modeling and analyses and will continue to consider ways to facilitate public participation in future rulemakings, which could include the use of workshops or webinars.

Some comments criticized the agencies for the agencies' untimeliness in adding materials to the rulemaking dockets, for example, identifying material "that was not added to the rulemaking docket until the end of the original comment period or, in some cases, added either after that period already had closed or not at all."<sup>2833</sup>

<sup>2832</sup> *Id.*

<sup>2833</sup> CBD et. al, Supplemental Comments, Docket No. NHTSA-2018-0067-12371, at 8.

The critical question is “whether the final rule changes critically from the proposed rule rather than on whether the agency relies on supporting material not published for comment.”<sup>2834</sup> In other words, “[t]he question is typically whether the agency’s final rule so departs from its proposed rule as to constitute more surprise than notice.”<sup>2835</sup> To that end, agencies are allowed—as the agencies here did—to rely on supplemental data that clarified, expanded on, or confirmed information in the proposed rule, even if that supplemental data was not disclosed in the proposed rule.<sup>2836</sup> In any event, the commenters have failed to show how they were prejudiced by any information posted later than they would have preferred.<sup>2837</sup>

Some commenters noted that certain aspects of the CAFE model used for the proposal were not previously subject to peer review.<sup>2838</sup> Certain commenters asserted that the proposal was legally flawed because the full CAFE model was not peer reviewed prior to the proposal.<sup>2839</sup> In support of this argument, commenters cited the Information Quality Act and related OMB guidance that states that “each agency shall have a peer review conducted on all influential scientific information that the agency intends to disseminate.”<sup>2840</sup> Commenters also cited EPA’s

Peer Review Handbook, which states: “For highly influential scientific assessments, external peer review is the expected procedure.”<sup>2841</sup>

The agencies agree that peer review is appropriate for the CAFE model, and the CAFE model has been peer reviewed. As discussed in the NPRM, and as certain commenters acknowledged, the CAFE model was peer reviewed in 2017.<sup>2842</sup> NHTSA included peer review materials in the public docket as well as on its webpage regarding the model.<sup>2843</sup> As described in those materials: “In 2017, the Volpe Center arranged for a formal peer review of the version of the CAFE model released and documented in 2016 . . . . All of the peer reviewers supported much about the model’s general approach, and supported many of the model’s specific characteristics. Peer reviewers also provided a variety of general and specific recommendations regarding potential changes to the model, inputs, outputs, and documentation. NHTSA and Volpe Center staff agree with many of these recommendations and have either completed or begun work to implement many of them; implementing others would require further research, testing, and development not possible at this time, but we are considering them for future model versions.”<sup>2844</sup>

<sup>2843</sup> NHTSA-2018-0067-0055; <https://www.nhtsa.gov/corporate-average-fuel-economy/compliance-and-effects-modeling-system>.

<sup>2844</sup> NHTSA-2018-0067-0055.

However, certain new elements of the CAFE model were not completed at the time of the 2017 peer review.<sup>2845</sup> NHTSA subsequently obtained a peer review of significant new elements added to the model after the 2017 peer review.<sup>2846</sup> As described in the new peer review charge, included in a July 2019 report included in the rulemaking docket, NHTSA explained:

To inform the proposed rule announced in August 2018, DOT staff introduced significant new elements to the model, including methods to estimate changes in vehicle sales volumes, vehicle scrappage, and automotive sector labor usage. Each of these regulatory actions involved consideration of and response to significant public comment on model results, as well as comments on the model itself. In addition to DOT staff's own observations, these comments led DOT staff to make a wide range of improvements to the model. Insofar as a formal peer review could identify additional potential opportunities to improve the model, DOT sponsored a review of the entire model in 2017. At this time, DOT seeks review of some of the significant new elements added to the model after that review.

This subsequent peer review of the new elements was not complete at the time the proposal was published, and therefore materials concerning the peer reviewers' comments and NHTSA's responses were not available until later.<sup>2847</sup> Although the comment period on the proposal had closed at that time, the agencies continued to receive comments on the new peer review materials, which they have considered in issuing this final rule.<sup>2848</sup> Of course, the new elements of the modeling were also described in detail in the NPRM and commenters also directly commented on them in great detail. Thus, the public was fully apprised of all aspects of the modeling and had a robust opportunity to provide comment.

---

<sup>2845</sup> NHTSA-2018-0067-0055 (explaining, in responses to 2017 peer review, that “[t]he model has been updated to including procedures to estimate impacts on new vehicle sales, and on older vehicle scrappage”).

<sup>2846</sup> NHTSA-2018-0067-0055.

<sup>2847</sup> NHTSA-2018-0067-0055 (July 2019 report).

<sup>2848</sup> *See, e.g.*, Center for Biological Diversity et al., NHTSA-2018-0067-12439; Environment America et al., NHTSA-2018-0067-12441.

To the extent commenters are suggesting the Information Quality Act required a full peer review of all aspects of the CAFE model *prior* to the proposal, the agencies disagree.<sup>2849</sup> Peer review of the new elements of the CAFE model helped ensure that the model is scientifically sound, and the peer reviewers provided feedback that helped improve the model and may help develop additional improvements to the model in the future. In this sense, the peer review of the new elements of the model functioned similarly to public comments from commenters with specific scientific expertise. Much of the feedback from the peer reviewers were in fact similar in nature to comments received from public commenters on the model. By engaging in both peer review and notice-and-comment procedures, the agencies ensured that they had information from a wide variety of sources, including those with specific expertise, to validate and improve the model.<sup>2850</sup> The technical aspects of the model, including improvements made to the model following the proposal, are described in detail in this final rule. Moreover, as the Center for Biological Diversity noted, the Information Quality Act does not create third-party rights.<sup>2851</sup>

The agencies also disagree that EPA needed to obtain a separate peer review of the CAFE model.<sup>2852</sup> The peer review addressed aspects of the model relevant to the analysis by both agencies under their respective statutory schemes. The agencies have expertise in their statutory requirements and discussed in detail both in the proposal and this final rule how the CAFE model was used to inform the decision-making under both EPCA and the CAA.

<sup>2849</sup> See, e.g., Center for Biological Diversity et al., NHTSA-2018-0067-12000; Environment America et al., NHTSA2018-0067-12441.

<sup>2850</sup> The timing of the peer review of new elements of the model also did not require a second cycle of notice and comment. See, e.g., *Alto Dairy v. Veneman*, 336 F.3d 560, 569-70 (7th Cir. 2003) (“The law does not require that every alteration in a proposed rule be reissued for notice and comment. If that were the case, an agency could ‘learn from the comments on its proposals only at the peril of subjecting itself to rulemaking without end.’”).

<sup>2851</sup> Center for Biological Diversity et al., NHTSA-2018-0067-12000.

<sup>2852</sup> Center for Biological Diversity et al., NHTSA-2018-0067-12000.

c) *Other APA Comments*

Many commenters suggested that the record of evidence developed for the 2016 Draft TAR and EPA’s Original Determination was a better basis for NHTSA to determine maximum feasible standards than the record of evidence for the current rulemaking. These commenters also argued that, in the NPRM, NHTSA ignored the findings and analysis in the TAR and the Technical Support Document and contradicted the pre-existing record without explanation. Lastly, these commenters argued that the NPRM did not have a reasoned basis under the APA, particularly in light of the agency’s change in position and the reliance interests at stake.

Agencies always have authority under the Administrative Procedure Act to revisit previous decisions in light of new facts, as long as they provide notice and an opportunity for comment—as the agencies did here. Indeed, it is the best practice to do so when changed circumstances so warrant.<sup>2853</sup>

“Changing policy does not, on its own, trigger an especially ‘demanding burden of justification.’”<sup>2854</sup> “Agencies are free to change their existing policies as long as they provide a reasoned explanation for the change.”<sup>2855</sup> Providing this explanation “would ordinarily demand that [the agency] display awareness that it *is* changing position.”<sup>2856</sup> Beyond that, however, “[w]hen an agency changes its existing position, it ‘need not always provide a more detailed

---

<sup>2853</sup> See *FCC v. Fox Television*, 556 U.S. 502 (2009).

justification than what would suffice for a new policy created on a blank slate.”<sup>2857</sup> The agency “need not demonstrate to a court’s satisfaction that the reasons for the new policy are *better* than the reasons for the old one.”<sup>2858</sup> For instance, “evolving notions” about the appropriate balance of varying policy considerations constitute sufficiently good reasons for a change in position.<sup>2859</sup> A change in policy is “well within an agency’s discretion:” agencies are permitted to conduct a “reevaluation of which policy would be better in light of the facts,” without “rely[ing] on new facts.”<sup>2860</sup>

To be sure, providing “a more detailed justification” is appropriate in some cases.<sup>2861</sup> But when “a more detailed justification” is needed, all that is required is for the agency to explain how “new information arising after” the previous determination “informed its conclusion” that a change was appropriate: “explanations relying on new data are sufficient to satisfy the more detailed explanatory obligation.”<sup>2862</sup> As one of the critical comments itself noted, “[a]gencies must use ‘the best information available’ in reaching their conclusions, and cannot lawfully rely on outdated information as circumstances change.”<sup>2863</sup> Accordingly, when new information

became available, the agencies relied on it expressly, resulting in a fully-explained change in their analysis and ultimately their conclusions.

While “[i]t would be arbitrary or capricious to ignore such matters,”<sup>2864</sup> the agencies have not ignored them. NHTSA has satisfied these standards. The NPRM expressly and repeatedly acknowledged that it represented a change from the 2012 final rule, the Draft TAR, and EPA’s Original Determination, appropriately justifying the change by citing shifts in policy priorities or new facts and changed circumstances that became apparent since the Original Determination.<sup>2865</sup> The agencies are fully cognizant of the facts and circumstances that have changed since the Original Determination, expressly acknowledged them in the Revised Determination and SAFE Rule NPRM, and adapted to accept them now in the final rule.

Several commenters invoked requests to the agencies under the Freedom of Information Act (“FOIA”) regarding material sought in connection with the rulemaking.<sup>2866</sup> These comments ranged from simple references to existing FOIA requests to the agencies, to the actual submission of the FOIA requests as a comment posted to the rulemaking docket.<sup>2867</sup> These commenters sought a variety of information, which included calendars and internal correspondence of specific agency personnel, communications with non-governmental

<sup>2866</sup> *See, e.g.*, Environmental Defense Fund, NHTSA-2018-0067-12371.

<sup>2867</sup> *Compare, e.g.*, Joint Submission from the States of California et al. and the Cities of Oakland et al., NHTSA NHTSA-2018-0067-11735, *with, e.g.*, Office of the Attorney General of the State of New York, NHTSA-2018-0067-3613.

stakeholders, and technical materials and clarifications relating to aspects of the agencies' analysis.<sup>2868</sup>

To the extent these requests sought substantive material, those matters are addressed in other sections herein that pertain to the respective underlying issues implicated. Although the submission of FOIA requests through an online rulemaking docket is a very unusual form of submitting a FOIA request to an agency, the agencies nevertheless processed the comments that requested materials by invoking FOIA as formal FOIA requests. As such, once identified, those comments were forwarded to the agencies' respective FOIA offices, which commenced the intake process of the letters as FOIA requests. In turn, the agencies' FOIA offices transmitted receipt acknowledgement letters to the requestors and conducted searches for the applicable material. The agencies responded to the requestors by producing the responsive non-exempt records identified, applying the appropriate FOIA standards applicable to the records and requests. Like all other typical FOIA requests, the requestors were provided with an opportunity to administratively appeal the FOIA decision and, if desired, subsequently seek judicial review of the agencies' decisions. Several commenters availed themselves of this procedure.<sup>2869</sup>

Thus, the agencies fully satisfied their obligations under the governing FOIA provisions. In fact, other commenters noted the agencies' responses to these FOIA requests and incorporated information disclosed in the responses into their comments.<sup>2870</sup> Moreover, several of the FOIA

---

<sup>2868</sup> See, e.g., Environmental Defense Fund, NHTSA-2018-0067-12397; Office of the Attorney General of the State of New York, NHTSA-2018-0067-3613; California Air Resources Board, NHTSA-2018-0067-4166.

<sup>2869</sup> See generally, e.g., New York v. U.S. Env'tl. Prot. Agency and Nat'l Highway Traffic Safety Admin., Case No. 1:19-cv-00712 (S.D.N.Y.) (FOIA litigation concerning a FOIA request submitted as a comment from the Office of the Attorney General of the State of New York, NHTSA-2018-0067-3613).

<sup>2870</sup> See James H. Stock, Kenneth Gillingham & Wade Davis, EPA-HQ-OAR-2018-0283-6220, at p. 6.

requests submitted as comments requested information that had already been published on the agencies' websites for the rulemaking or in the rulemaking dockets.

Although the agencies fulfilled their obligations under all applicable FOIA law, the agencies also stress that FOIA compliance is wholly irrelevant to conformity to governing APA standards in the rulemaking process. FOIA arises from an independent statutory framework, which contains unique provisions for judicial review.<sup>2871</sup> These provisions for judicial review provide “an adequate form of relief” such that the APA is not typically even an appropriate mechanism to seek the disclosure of further information requested under FOIA.<sup>2872</sup> Likewise, the APA’s principles governing rulemaking procedures, including disclosures of information for such rulemakings, exist as autonomous statutory and jurisprudential concepts totally untethered from the principles of disclosure under FOIA.

Similarly, as an independent statutory framework from the APA, the susceptibility of materials and records for production under FOIA has no bearing on whether such materials should have been made public under the APA as part of a rulemaking. The scope of materials for production under FOIA arises from the Agency’s reasonable interpretation of the language of the FOIA request, as well as the exemptions potentially applicable to the records under the applicable FOIA statutes and implementing regulations.<sup>2873</sup> In contrast, in an APA review of rulemaking procedures, separate standards exist to govern the scope of materials an agency must

---

<sup>2871</sup> 5 U.S.C. 552(a)(4)(B).

<sup>2872</sup> *See, e.g.,* *Feinman v. FBI*, 713 F. Supp. 2d 70, 76 (D.D.C. 2010) (“This court and others have uniformly declined jurisdiction over APA claims that sought remedies made available by FOIA.”).

<sup>2873</sup> *See* 5 U.S.C. 552. *See also, e.g.,* *Weisberg v. U.S. Dep’t of Justice*, 745 F.2d 1476, 1485 (D.C. Cir. 1984) (discussing standards applicable to the scope of an Agency’s search for records under FOIA).

make available during the rulemaking process.<sup>2874</sup> Thus, records may be responsive to a FOIA request, but not appropriate for publication under the APA—even if the FOIA request concerns the proposed rule in question. The FOIA requests at issue here are illustrative of this distinction. For example, one of the specific FOIA requests identified by commenters describes the requests as pertaining to the NPRM, but seeks Outlook calendars of DOT and NHTSA personnel.<sup>2875</sup> While such materials may be responsive to the underlying FOIA requests, which expressly mention the calendars, an employee’s entire list of calendar appointments—including appointments unrelated to the rulemaking—is clearly not contemplated by the APA as material necessary for publication along with a proposed rule. Thus, while the agencies sought to comply with their independent statutory obligations under FOIA, to the extent commenters invoke purported FOIA noncompliance, the agencies consider such arguments irrelevant to the rulemaking analysis. Likewise, any production of records in connection with any FOIA request that invokes the proposed rule is not a recognition by the agencies that the material should have also been made available during the rulemaking under the APA.

Several commenters also criticized the agencies, and specifically the EPA, for not publishing an updated version of the Optimization Model for Reducing Emissions of Greenhouse Gases from Automobiles (“OMEGA”) along with the proposed rule.<sup>2876</sup> As described in further detail in Section IV herein, OMEGA is a fleet compliance model developed by the EPA and used in previous rulemakings. While many commenters raised technical arguments comparing the OMEGA model to the CAFE Model utilized in this rulemaking, such technical analysis and

---

<sup>2874</sup> See *Air Transp. Ass’n of Am. v. F.A.A.*, 169 F.3d 1, 7 (D.C. Cir. 1999) (discussing the scope of materials for an agency to make available during a notice and comment period).

<sup>2875</sup> See Environmental Defense Fund, NHTSA-2018-0067-12397.

<sup>2876</sup> See, e.g., International Council on Clean Transportation, NHTSA-2018-0067-11741.

comments are addressed elsewhere in this final rule analysis. *See* Section IV. Likewise, while several comments refer to FOIA requests for OMEGA model materials, the Agencies' discussion of FOIA comments are addressed above.

Most other commenters who raised more procedural arguments concerning the unavailability of an updated version of the OMEGA model argued that an updated version of the model should have been released because the EPA utilized the model during an interagency review of the proposed rule.<sup>2877</sup> In considering these comments, the agencies emphasize that neither NHTSA, the EPA, nor any other interagency reviewer relied upon the OMEGA model for the preparation of either the proposed or the final versions of the SAFE Vehicles Rule. Instead, as clearly expressed in rulemaking descriptions and documents accompanying both this final rule and the proposed rule, the agencies relied on a separate model to perform the analysis that helped to inform the agencies regarding potential effects of various fuel economy standards. This independent model, the CAFE Model, was developed by the Department of Transportation's Volpe National Transportation Systems Center.

In fact, most commenters discussing the OMEGA model understood and expressly acknowledged that the agencies relied upon the CAFE Model rather than the OMEGA model for this rulemaking.<sup>2878</sup> Several commenters even paradoxically argued *both* that the agencies unreasonably failed to utilize the OMEGA model *and* that the agencies denied meaningful opportunity for comment by utilizing but failing to publish an updated OMEGA model.<sup>2879</sup>

---

<sup>2877</sup> *See, e.g.*, Sallie E. Davis, NHTSA-2018-0067-12430.

<sup>2878</sup> *See, e.g.*, Union of Concerned Scientists, NHTSA-2018-0067-12303-016; Center for Biological Diversity, NHTSA-2018-0067-12000.

<sup>2879</sup> *See, e.g.*, Environmental Defense Fund, NHTSA-2018-0067-12108.

Nevertheless, the analysis and universe of documents published for the proposed rule made abundantly clear that the CAFE Model—not the OMEGA model—performed the applicable analysis for this rulemaking. Likewise, the agencies’ proposed rule published voluminous analyses and supporting documents to describe the CAFE Model and explain the underlying methodologies incorporated into the model’s operation for this rulemaking. The agencies also released the full version of the CAFE Model employed in this rulemaking, as well as its respective inputs and outputs, in order to provide commenters with ample opportunities to understand the model’s function and operation.

The extensive comments on the modeling conducted for this rulemaking confirm that the agencies provided the public with sufficient information to comment on the modeling process for the rulemaking. Comments regarding the OMEGA and CAFE models were expansive, spanning hundreds of pages of technical analysis and submissions from a variety of commenters. Many of these comments even consisted of detailed and technical comparisons of the CAFE model used in this rulemaking with past versions of OMEGA models used for prior rulemakings.<sup>2880</sup> Even if certain of these commenters disagreed with the Agencies’ ultimate approach to the modeling, they evidently understood the applicable methodologies and performance of the CAFE Model for this rulemaking sufficiently to substantively engage with the Agencies on these topics through their comments. Therefore, the agencies consider the detailed comments on the OMEGA and CAFE models as clear indicia that the extensive information, materials, and explanations

---

<sup>2880</sup> See, e.g., California Air Resources Board, NHTSA-2018-0067-11873; Union of Concerned Scientists, NHTSA-2018-0067-12039; Alliance of Automobile Manufacturers, NHTSA-2018-0067-12073.

provided by the agencies in the proposed rule enabled significant opportunity for the public to comment on the modeling for the rule.

To the extent that commenters allege an insufficient opportunity to comment by claiming that the EPA actually utilized the OMEGA model in the rulemaking process, the agencies consider such comments unfounded.<sup>2881</sup> The agencies did not rely on the OMEGA model during the rulemaking process, including during the analysis for the proposed and final rules. In past rulemakings, the EPA developed a complete final version of the OMEGA model to perform the rulemaking analysis. Here, the EPA did not even finalize a completed updated version of the OMEGA model, much less rely on such a model in the course of the rulemaking. Therefore, no completed version of an updated OMEGA model even existed for the agencies to publish as part of the notice of proposed rulemaking.

To the extent commenters argue that the EPA *should* have updated the model for this rulemaking, the APA's facilitation of a meaningful opportunity to comment neither requires nor contemplates a mandate that the agencies develop computational modeling alternatives for the public, which were not even incorporated into the agencies' own rulemaking analysis.<sup>2882</sup> In fact, doing so would actually detract from the notice and comment process because it would convolute the rulemaking docket and inhibit the public's ability to identify the modeling materials actually used in the rulemaking process. Thus, such extraneous materials would only dilute the rulemaking docket with voluminous and complex materials, such as modeling files,

---

<sup>2881</sup> See, e.g., Center for Biological Diversity, NHTSA-2018-0067-12000.

<sup>2882</sup> See, e.g., Center for Biological Diversity et al., NHTSA-2018-0067-12000.

input files, and statistical figures, that had no influence on the rulemaking in question. Indeed, several commenters already claimed that the voluminous and complex supporting materials in the rulemaking docket required significant time for review, so the introduction of extensive totally extraneous material would have been only counterproductive to the process.<sup>2883</sup>

Moreover, requiring the EPA to perform the work necessary to fully update the OMEGA model solely for a public release—when it did not otherwise intend to consider the model in the rulemaking—would divert valuable and finite agency resources away from actual rulemaking analyses in favor of efforts that further no progress in the rulemaking.<sup>2884</sup> Such an approach would detract from the agencies’ opportunities to devote time to other considerations that actually influenced the rulemaking, such as the substantive analysis incorporated into the proposed rule and the drafting of extensive language to explain to the public the methodologies applied by the agencies for the proposal. Such an inefficient allocation of resources undermines both the rulemaking process envisioned by the APA and the very notice and comment procedures utilized by these commenters.

Several commenters also argued that even if the agencies did not rely on the model for this rulemaking, the OMEGA model still informed the EPA’s analysis and interagency review by providing general background experience in regulating greenhouse gas emissions—either through the agency’s work with prior versions of the model or ongoing efforts to update the OMEGA model for purposes unrelated to this rulemaking. However, even assuming the model

---

<sup>2883</sup> See, e.g., Institute for Policy Integrity, NHTSA-2018-0067-5641; Northeast States for Coordinated Air Use Management, NHTSA-2018-0067-2158.

<sup>2884</sup> See, e.g., Environmental Defense Fund, NHTSA-2018-0067-12108.

provided background experience to the EPA in regulating in this arena, federal jurisprudence makes clear that “[t]he Administrative Procedure Act does not require that every bit of background information used by an administrative agency be published for public comment.” *See B. F. Goodrich Co. v. Dep’t of Transp.*, 541 F.2d 1178, 1184 (6th Cir. 1976). This is particularly the case when, as here, “[t]he basic data upon which the agency relied in formulating the regulation was available...for comment.” *Id.*; *see also Am. Min. Cong. v. Marshall*, 671 F.2d 1251, 1261 (10th Cir. 1982) (“These documents consist of background information and data as well as several internal memoranda. There is nothing to indicate that the Secretary actually relied on any of these documents in promulgating the rule or that the data they contain was critical to the formulation of the rule.”). In fact, publishing such background information not only exceeds the requirements of the APA, but would actually affirmatively undermine the APA’s notice and comment procedure. If every piece of information ever referenced by the agencies or upon which the Agencies drew regulatory experience were required to be published, rulemaking dockets would expand to an absurd scope of nearly infinite materials, spanning arguably back to even the school textbooks the rulemaking personnel used to learn the underlying disciplines employed in the rulemaking analysis. Clearly such a scope would frustrate rather than further the provision of proper notice to the public about a proposed rule.<sup>2885</sup>

---

<sup>2885</sup> To the extent commenters seek to understand the manner in which the OMEGA model informed prior rulemaking efforts, the EPA has released the full versions of prior OMEGA models and applicable materials along with the prior rulemakings. In fact, several commenters referenced such materials in submitting detailed comments comparing the CAFE Model with the OMEGA model. Manufacturers of Emission Controls Association, NHTSA-2018-0067-11994. Thus, any commenters that were interested in such extraneous background information had ample opportunity to access the material.

Moreover, even assuming the premise of several commenters' challenges—that the EPA consulted updates to the OMEGA model during the interagency review—such a predicate still would not require the publication of the model during the rulemaking process.<sup>2886</sup> As the agencies have made clear, the OMEGA model did not affect any part of the rule, including the methodologies and analysis underlying the formulation of the rule. Therefore, even if consulted, the OMEGA model would exist as, at most, supplementary material which had no influence on the rulemaking methodologies, all of which were fully disclosed. *See, e.g., Chamber of Commerce of U.S. v. S.E.C.*, 443 F.3d 890, 900 (D.C. Cir. 2006) (“When the agency relies on supplementary evidence without a showing of prejudice by an interested party, the procedural requirements of the APA are satisfied without further opportunity for comment, provided that the agency's response constitutes a logical outgrowth of the rule initially proposed”) (internal citations omitted).

### 3. National Environmental Policy Act

As discussed above, EPCA requires NHTSA to determine the level at which to set CAFE standards for each model year by considering the four factors of technological feasibility, economic practicability, the effect of other motor vehicle standards of the Government on fuel economy, and the need of the United States to conserve energy. The National Environmental Policy Act (NEPA) directs that environmental considerations be integrated into that process.<sup>2887</sup> To explore the potential environmental consequences of this rulemaking action, NHTSA

---

<sup>2886</sup> *See, e.g.*, Environmental Defense Fund, NHTSA-2018-0067-12406.

<sup>2887</sup> NEPA is codified at 42 U.S.C. 4321–47. The Council on Environmental Quality (CEQ) NEPA implementing regulations are codified at 40 CFR parts 1500–08.

prepared a Draft Environmental Impact Statement (“DEIS”) for the NPRM and a Final Environmental Impact Statement (“FEIS”) for the final rule. The purpose of an EIS is to “provide full and fair discussion of significant environmental impacts and [to] inform decisionmakers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment.”<sup>2888</sup>

As explained in the NPRM, NEPA is “a procedural statute that mandates a process rather than a particular result.”<sup>2889</sup> The agency’s overall EIS-related obligation is to “take a ‘hard look’ at the environmental consequences before taking a major action.”<sup>2890</sup> Significantly, “[i]f the adverse environmental effects of the proposed action are adequately identified and evaluated, the agency is not constrained by NEPA from deciding that other values outweigh the environmental costs.”<sup>2891</sup> The agency must identify the “environmentally preferable” alternative but need not adopt it.<sup>2892</sup> “Congress in enacting NEPA . . . did not require agencies to elevate environmental concerns over other appropriate considerations.”<sup>2893</sup> Instead, NEPA requires an agency to develop and consider alternatives to the proposed action in preparing an EIS.<sup>2894</sup> The statute and implementing regulations do not command the agency to favor an environmentally preferable course of action, only that it make its decision to proceed with the action after taking a hard look at the potential environmental consequences and consider the relevant factors in making a decision among alternatives.<sup>2895</sup>

---

<sup>2888</sup> 40 CFR 1502.1.

<sup>2890</sup> *Baltimore Gas & Elec. Co. v. Natural Resources Defense Council, Inc.*, 462 U.S. 87, 97 (1983).

<sup>2891</sup> *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 350 (1989).

<sup>2892</sup> 40 CFR 1505.2(b).

<sup>2893</sup> *Baltimore Gas*, 462 U.S. at 97.

<sup>2894</sup> 42 U.S.C. 4332(2)(C)(iii).

<sup>2895</sup> 40 CFR 1505.2(b).

NHTSA received many comments on the DEIS. Among the comments received, many commenters stated that the baseline/no-action standards were the environmentally preferable alternative and argued that the environmental benefits of the proposal were (1) insufficient and/or (2) incorrectly assessed in a variety of ways. Comments regarding the environmental analyses presented in this preamble are addressed in Section VI above, while those regarding the DEIS are addressed in Chapter 10 of the FEIS.

When preparing an EIS, NEPA requires an agency to compare the potential environmental impacts of its proposed action and a reasonable range of alternatives. In the DEIS, NHTSA analyzed a No Action Alternative and eight action alternatives. In the FEIS, NHTSA analyzed the same No Action Alternative and seven action alternatives, including a new alternative (the Preferred Alternative) within the range of the alternatives considered in the DEIS and FEIS.<sup>2896</sup> The alternatives represent a range of potential actions the agency could take, and they are described more fully in Section V above, below in this section, and Chapter 2 of the FEIS. The environmental impacts of these alternatives, in turn, represent a range of potential environmental impacts that could result from NHTSA's setting maximum feasible fuel economy standards for passenger cars and light trucks.

To derive the direct and indirect impacts of the action alternatives, NHTSA compared each action alternative to the No Action Alternative, which reflects baseline trends that would be expected in the absence of any further regulatory action other than finalizing the augural

---

<sup>2896</sup> In its scoping notice, NHTSA indicated that the action alternatives analyzed would bracket a range of reasonable annual fuel economy standards, allowing the agency to select an action alternative in its final rule from any stringency level within that range. 82 FR 34740, 34743 (July 26, 2017).

standards. More specifically, the No Action Alternative in the DEIS and FEIS assumed that NHTSA would not amend the CAFE standards for MY 2021 passenger cars and light trucks. In addition, the No Action Alternative assumed that NHTSA would finalize the MY 2022-2025 augural CAFE standards that were described in the 2012 final rule. Finally, for purposes of its analysis, NHTSA assumed that the MY 2025 augural standards would continue indefinitely. The augural standards also serve as a proxy for EPA's CO<sub>2</sub> standards for MYs 2022-2025, which were also finalized in the 2012 final rule. The No Action Alternative provides an analytical baseline against which to compare the environmental impacts of other alternatives presented in the EIS.<sup>2897</sup>

For the DEIS, NHTSA analyzed eight action alternatives, Alternatives 1 through 8, which ranged from amending the MY 2021 standards to match the MY 2020 standards and holding those standards flat for passenger cars and light trucks through MY 2026 (Alternative 1) to maintaining the existing MY 2021 standards and subsequently requiring average annual increases in fuel economy by 2.0 percent (passenger cars) and 3.0 percent (light trucks) (Alternative 8). The action alternatives analyzed in the DEIS also reflected different options regarding air conditioning efficiency and off-cycle technology adjustment procedures, with some alternatives phasing out these adjustments in MYs 2022-2026. For the FEIS, NHTSA analyzed seven action alternatives, Alternatives 1 through 7, which range from amending the MY 2021 standards to match the MY 2020 standards and holding those standards flat for passenger cars

---

<sup>2897</sup> See 40 CFR 1502.2(e), 1502.14(d). CEQ has explained that “[T]he regulations require the analysis of the no action alternative even if the agency is under a court order or legislative command to act. This analysis provides a benchmark, enabling decision makers to compare the magnitude of environmental effects of the action alternatives [See 40 CFR 1502.14(c).] . . . Inclusion of such an analysis in the EIS is necessary to inform Congress, the public, and the President as intended by NEPA. [See 40 CFR 1500.1(a).]” Forty Most Asked Questions Concerning CEQ’s National Environmental Policy Act Regulations, 46 FR 18026 (Mar. 23, 1981).

and light trucks through MY 2026 (Alternative 1) to maintaining the existing MY 2021 standards and subsequently requiring average annual increases in fuel economy by 2.0 percent (passenger cars) and 3.0 percent (light trucks) (Alternative 7) from year to year. The primary differences between the action alternatives for the DEIS and FEIS is that the FEIS did not analyze alternatives that phased out the air conditioning efficiency and off-cycle technology adjustments (see Section V above for further discussion), and the FEIS added an alternative under which fuel economy increased at 1.5 percent per year for both cars and light trucks (Alternative 3). Both of the ranges of action alternatives, as well as the No Action Alternative, in the DEIS and FEIS encompassed a spectrum of possible standards NHTSA could determine was maximum feasible based on the different ways the agency could weigh EPCA's four statutory factors. Throughout the FEIS, estimated impacts were shown for all of these action alternatives, as well as for the No Action Alternative. For a more detailed discussion of the environmental impacts associated with the alternatives, *see* Chapters 3-8 of the FEIS, as well as Section VII above.

NHTSA's FEIS describes potential environmental impacts to a variety of resources, including fuel and energy use, air quality, climate, land use and development, hazardous materials and regulated wastes, historical and cultural resources, noise, and environmental justice. The FEIS also describes how climate change resulting from global carbon emissions (including CO<sub>2</sub> emissions attributable to the U.S. light duty transportation sector under the alternatives considered) could affect certain key natural and human resources. Resource areas

are assessed qualitatively and quantitatively, as appropriate, in the FEIS, and the findings of that analysis are summarized here.<sup>2898</sup>

As the stringency of the alternatives increases, total U.S. passenger car and light truck fuel consumption for the period of 2020 to 2050 decreases. Total light-duty vehicle fuel consumption from 2020 to 2050 under the No Action Alternative is projected to be 3,371 billion gasoline gallon equivalents (GGE). Light-duty vehicle fuel consumption from 2020 to 2050 under the action alternatives is projected to range from 3,598 billion GGE under Alternative 1 to 3,456 billion gallons GGE under Alternative 7. Under the Alternative 3, light-duty vehicle fuel consumption from 2020 to 2050 is projected to be 3,571 GGE. All of the action alternatives would increase fuel consumption compared to the No Action Alternative, with fuel consumption increases that range from 226 billion GGE under Alternative 1 to 85 billion GGE under Alternative 7.

The relationship between stringency and air pollutant emissions is less straightforward, reflecting the complex interactions among the tailpipe emissions rates of the various vehicle types, the technologies assumed to be incorporated by manufacturers in response to the CAFE standards, upstream emissions rates, the relative proportions of gasoline and diesel in total fuel consumption, and changes in VMT from the rebound effect. In general, emissions of criteria and toxic air

---

<sup>2898</sup> The impacts described in this section come from NHTSA's FEIS, which is being publicly issued simultaneously with this final rule. As described in Section VII.A.4.c.1 above, the FEIS is based on "unconstrained" modeling rather than "standard setting" modeling; NHTSA conducts modeling both ways in order to reflect the various statutory requirements of EPCA and NEPA. The preamble employs the "standard setting" modeling in order to ensure that the decision-maker does not consider things that EPCA/EISA prohibit, but as a result, the impacts reported here may differ from those reported elsewhere in this preamble. However, NHTSA considers the impacts reported in the FEIS, in addition to the other information presented in this preamble, as part of its decision-making process.

pollutants increase across all action alternatives, with some exceptions. Further, the action alternatives would result in increased incidence of PM<sub>2.5</sub>-related adverse health impacts (including increased incidences of premature mortality, acute bronchitis, respiratory emergency room visits, and work-loss days) due to the emissions increases.<sup>2899</sup>

For CO (in 2025), NO<sub>x</sub> (in 2025), and SO<sub>2</sub>, emissions generally decrease under the action alternatives compared to the No Action Alternative. For CO in 2025, the largest decrease occurs under Alternative 1 and the emissions decreases get smaller from Alternative 1 through Alternative 7. For NO<sub>x</sub> in 2025, the largest decrease occurs under Alternative 6. For SO<sub>2</sub> in 2025, the largest decrease occurs under Alternative 6; however, SO<sub>2</sub> emissions under Alternative 7 are greater than under the No Action Alternative. For SO<sub>2</sub> in 2035, the largest decrease occurs under Alternative 2. For SO<sub>2</sub> in 2050, the largest decrease occurs under Alternative 1 and the emissions decreases get smaller from Alternative 1 through Alternative 7. Across all criteria pollutants, action alternatives, and analysis years, the smallest decrease in emissions is less than 0.1 percent and occurs for NO<sub>x</sub> under Alternative 7 in 2025; the largest decrease is 12 percent and occurs for SO<sub>2</sub> under Alternative 2 in 2050.

For CO (in 2035 and 2050), NO<sub>x</sub> (in 2035 and 2050), PM<sub>2.5</sub>, and VOCs, emissions show increases across action alternatives compared to the No Action Alternative, with the largest increases occurring under Alternative 1 (except CO in 2035, for which the largest increase occurs under Alternative 4). The emissions increases get smaller from Alternative 1 through

---

<sup>2899</sup> As discussed in Section X.E.1, NHTSA also performed a national-scale photochemical air quality modeling and health benefit assessment for the FEIS, which is included as Appendix E. This analysis affirms the estimates that appeared in the DEIS and explains conclusions that may be drawn from the FEIS air quality discussion.

Alternative 7. Exceptions to this trend are for PM<sub>2.5</sub> and VOCs in 2025, which show the smallest emissions increase under Alternative 6. Across all criteria pollutants, action alternatives, and analysis years, the smallest increase in emissions is 0.1 percent and occurs for SO<sub>2</sub> under Alternative 7 in 2025; the largest increase is 12 percent and occurs for VOCs under Alternative 1 in 2050.

Under each action alternative in 2025 compared to the No Action Alternative, decreases in emissions would occur for all toxic air pollutants except for DPM, for which emissions would increase by as much as 2 percent. For 2025, the largest relative decreases in emissions would occur for 1,3,-butadiene, for which emissions would decrease by as much as 0.5 percent. Percentage reductions in emissions of acetaldehyde, acrolein, benzene, and formaldehyde would be less. Under each action alternative in 2035 and 2050 compared to the No Action Alternative, increases in emissions would occur for all toxic air pollutants. The largest relative increases in emissions would occur for DPM, for which emissions would increase by as much as 9 percent. Percentage increases in emissions of acetaldehyde, acrolein, benzene, 1,3,-butadiene, and formaldehyde would be less.

In addition, the action alternatives would result in increased incidence of PM<sub>2.5</sub>-related adverse health impacts due to the emissions increases. Increases in adverse health outcomes include increased incidences of premature mortality, acute bronchitis, respiratory emergency room visits, and work-loss days. In 2025 and 2035, all action alternatives except for Alternative 6 would result in increased adverse health impacts nationwide compared to the No Action Alternative as a result of increases in emissions of NO<sub>x</sub>, PM<sub>2.5</sub>, and DPM. The increases in adverse health impacts are largest for the least stringent alternative (Alternative 1). The increases get smaller from Alternative 1 to Alternative 4, get larger from Alternative 4 to

Alternative 5, then smaller from Alternative 5 to Alternative 6, and larger again from Alternative 6 to Alternative 7. In 2050, all action alternatives would result in decreased adverse health impacts nationwide compared to the No Action Alternative as a result of decreases in emissions of SO<sub>x</sub>. The decreases in adverse health impacts get smaller from Alternative 1 to Alternative 7.

The action alternatives would increase U.S. passenger car and light truck fuel consumption and CO<sub>2</sub> emissions compared with the No Action Alternative, resulting in minor increases to the anticipated increases in global CO<sub>2</sub> concentrations, temperature, precipitation, and sea level, and minor decreases in ocean pH that would otherwise occur, as described below. They could also, to a small degree, increase the impacts and risks of climate change. Uncertainty exists regarding the magnitude of impact on these climate variables, as well as to the impacts and risks of climate change. Still, the impacts of the action alternatives on global mean surface temperature, precipitation, sea level, and ocean pH would be extremely small in relation to global emissions trajectories. This is because of the global and multi-sectoral nature of climate change. These effects would be small, would occur on a global scale, and would not disproportionately affect the United States.

According to the FEIS, passenger cars and light trucks are projected to emit 85,900 million metric tons of carbon dioxide (MMTCO<sub>2</sub>) from 2021 through 2100 under the No Action Alternative. Alternative 1 would increase these emissions by 10 percent through 2100 (approximately 8,800 MMTCO<sub>2</sub>). Alternative 7 would increase these emissions by 4 percent through 2100 (approximately 3,100 MMTCO<sub>2</sub>). Emissions increases would be highest under Alternative 1 and would decrease across the action alternatives, with emissions being the lowest under the No Action Alternative.

In the FEIS, NHTSA presented two different analyses based on these emissions changes to illustrate potential impacts to certain climate variables. In the first analysis, to represent the direct and indirect impacts of this action, NHTSA used the Global Change Assessment Model (GCAM) Reference scenario (i.e., future global emissions assuming no additional climate policy [“business-as-usual”]) to represent the reference case emissions scenario. Under that analysis, total global CO<sub>2</sub> emissions from all sources are projected to be 4,950,865 MMTCO<sub>2</sub> under the No Action Alternative from 2021 through 2100, which means that the action alternatives are expected to increase global CO<sub>2</sub> emissions between 0.06 (Alternative 7) and 0.17 (Alternative 1) percent by 2100. The estimated CO<sub>2</sub> concentrations in the atmosphere for 2100 would range from 789.89 parts per million (ppm) under Alternative 1 to approximately 789.11 ppm under the No Action Alternative, indicating a maximum atmospheric CO<sub>2</sub> increase of approximately 0.78 ppm compared to the No Action Alternative.

Changes in CO<sub>2</sub> emissions translate to changes in global mean surface temperature, sea levels, global mean precipitation, and ocean pH, among other things. Under the first analysis, global mean surface temperature is projected to increase by approximately 3.48°C (6.27°F) under the No Action Alternative by 2100. Implementing the lowest-emissions action alternative (Alternative 7) would increase this projected temperature rise by 0.001°C (0.002°F), while implementing the highest-emissions alternative (Alternative 1) would increase projected temperature rise by 0.003°C (0.005°F). Projected sea-level rise in 2100 ranges from a low of 76.28 centimeters (30.03 inches) under the No Action Alternative to a high of 76.35 centimeters (30.06 inches) under Alternative 1. Alternative 1 would result in an increase in sea level equal to 0.07 centimeter (0.03 inch) by 2100 compared with the level projected under the No Action Alternative, compared to an increase under Alternative 7 of 0.02 centimeter (0.001 inch)

compared with the No Action Alternative. Global mean precipitation is anticipated to increase by 5.85 percent by 2100 under the No Action Alternative. Under the action alternatives, this increase in precipitation would be increased further by 0.01 percent. Finally, ocean pH in 2100 is anticipated to be 8.2715 under Alternative 7, about 0.0001 less than the No Action Alternative. Under Alternative 1, ocean pH in 2100 would be 8.2712, or 0.0004 less than the No Action Alternative.

In the second analysis, NHTSA used the GCAM6.0 scenario instead of the default scenario to represent the reference case emissions scenario. The GCAM6.0 scenario assumes a moderate level of global GHG reductions and corresponds to stabilization, by 2100, of total radiative forcing and associated CO<sub>2</sub> concentrations at roughly 678 ppm. By assuming a moderate level of global GHG reduction, NHTSA attempts to capture the cumulative impacts of this action (i.e., the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions). In the FEIS, NHTSA documented a number of domestic and global actions that indicate that a moderate reduction in the growth rate of global GHG emissions is reasonably foreseeable in the future.

Under the second analysis, compared with projected total global CO<sub>2</sub> emissions of 4,044,005 MMTCO<sub>2</sub> from all sources from 2021 to 2100, the incremental impact of this rulemaking is expected to increase global CO<sub>2</sub> emissions between 0.08 (Alternative 7) and 0.22 (Alternative 1) percent by 2100. Estimated atmospheric CO<sub>2</sub> concentrations in 2100 range from a low of 687.3 ppm under the No Action Alternative to a high of 688.04 ppm under Alternative 1. Alternative 7, the lowest CO<sub>2</sub> emissions alternative, would result in CO<sub>2</sub> concentrations of 687.55 ppm, an increase of 0.26 ppm compared with the No Action Alternative. Global mean

surface temperature increases for the action alternatives compared with the No Action Alternative in 2100 range from a low of 0.001°C (0.002°F) under Alternative 7 to a high of 0.004°C (0.007°F) under Alternative 1. Global mean precipitation is anticipated to increase by 4.77 percent by 2100 under the No Action Alternative. Under the action alternatives, this increase in precipitation would be increased further by 0.01 percent. Projected sea-level rise in 2100 ranges from a low of 70.22 centimeters (27.65 inches) under the No Action Alternative to a high of 70.30 centimeters (27.68 inches) under Alternative 1, indicating a maximum increase of sea-level rise of 0.07 centimeter (0.03 inch) by 2100. Sea-level rise under Alternative 7 would be 70.25 centimeters (27.66 inches), a 0.03 centimeter (0.01-inch) increase compared to the No Action Alternative. Ocean pH in 2100 is anticipated to be 8.2721 under Alternative 7, about 0.0001 less than the No Action Alternative. Under Alternative 1, ocean pH in 2100 would be 8.2719, or 0.0004 less than the No Action Alternative.

For several other resources, NHTSA is unable to provide a quantitative measurement of potential impacts. Instead, the FEIS presents a qualitative discussion on potential impacts. In most cases, NHTSA presents the findings of a literature review of scientific studies, such as in Chapter 6, where NHTSA provides a literature synthesis focusing on existing credible scientific information to evaluate the most significant lifecycle environmental impacts from some of the fuels, materials, and technologies that may be used to comply with the alternatives. In Chapter 7, NHTSA discusses land use and development, hazardous materials and regulated waste, historical and cultural resources, noise, and environmental justice. Finally, in Chapter 8, NHTSA discusses cumulative impacts related to energy, air quality, and climate change, and provides a literature synthesis of the impacts on key natural and human resources of changes in climate change variables. In these chapters, NHTSA concludes that impacts would be proportional to

changes in emissions that would result under the alternatives. As a result, among the action alternatives, Alternative 1 would have the highest impact on these resources while Alternative 7 would have the lowest.

Based on the foregoing, NHTSA concludes from the FEIS that the No Action Alternative is the overall environmentally preferable alternative because, assuming full compliance were achieved regardless of the agency's assessment of the costs to industry and society, it would result in the largest reductions in fuel use and CO<sub>2</sub> emissions among the alternatives considered. In addition, the No Action Alternative would result in the lowest overall emissions levels of criteria air pollutants (with the exception of sulfur dioxide) and of the toxic air pollutants studied by NHTSA. Impacts on other resources (especially those described qualitatively in the FEIS) would be proportional to the impacts on fuel use and emissions, as further described in the FEIS, with the No Action Alternative expected to have the fewest negative impacts.<sup>2900</sup> Although the CEQ regulations require NHTSA to identify the environmentally preferable alternative,<sup>2901</sup> the agency need not adopt it, as described above. The following section (Section VIII.B.4) explains how NHTSA balanced the relevant factors to determine which alternative represented the maximum feasible standards, including why NHTSA does not believe that the environmentally preferable alternative is maximum feasible.

---

<sup>2900</sup> Among the action alternatives considered, Alternative 7 would be the environmentally preferable alternative, as it is closest in stringency to the No Action Alternative.

<sup>2901</sup> 40 CFR 1505.2(b).

#### 4. Evaluating the EPCA Factors and Other Considerations to Arrive at the Proposed Standards

As discussed in this section, NHTSA is required to consider four enumerated factors when establishing maximum feasible CAFE standards under 49 U.S.C. chapter 329: “technological feasibility, economic practicability, the effect of other motor vehicle standards of the Government on fuel economy, and the need of the United States to conserve energy.”<sup>2902</sup> For this final rule, NHTSA has considered a wide range of potential CAFE standards (Baseline/No Action Alternative and Alternatives 1 through 7), ranging from the augural standards set forth in 2012 (Baseline/No Action Alternative), through a number of less stringent alternatives, including the proposed preferred alternative (Alternative 1, 0 percent per year stringency improvement) and what has been chosen as the final standards (Alternative 3, 1.5 percent per year stringency improvement). NHTSA has determined that Alternative 3, which would increase the stringency of the MY 2020 standards by 1.5 percent per year for both passenger cars and light trucks from MY 2021 through 2026, represents the maximum feasible CAFE standards under 49 U.S.C. 39202. In addition to technological feasibility, economic practicability, the effects of other motor vehicle standards of the Government on fuel economy, and the need of the United States to conserve energy, NHTSA has also considered the impact of the standards on safety and the environment.

---

<sup>2902</sup> 49 U.S.C. 32902(f).

*How did the Agency Balance the Factors for the NPRM?*

In the NPRM, NHTSA began its discussion of the tentative balancing of factors by explaining that “NHTSA well recognizes that the decision it proposes to make in today’s NPRM is different from the one made in the 2012 final rule that established standards for MY 2021 and identified “augural” standard levels for MYs 2022-2025. Not only do we believe that the facts before us have changed, but we believe that those facts have changed sufficiently that the balancing of the EPCA factors and other considerations must also change. The standards we are proposing today reflect that balancing.”<sup>2903</sup> NHTSA highlights this discussion at the outset in response to the number of commenters who claimed that NHTSA had not acknowledged or explained in the NPRM how or why the proposal was different from past work or policy decisions.

The NPRM balancing discussion went on to explore the definition of “to conserve” in the context of what “energy conservation” and “the need of the U.S. to conserve energy” should be interpreted to mean, in recognition of the major structural changes in global oil markets since EPCA was originally passed, and even since the 2012 final rule that set forth the augural standards. NHTSA examined these changes from both a demand perspective and a supply perspective. On the demand side, U.S. demand and global demand have both changed over time. The NPRM discussed the fact that the U.S. consumes a much smaller share of global oil output than it did at the CAFE program’s outset, both because U.S. fleet fuel economy has improved, and because other countries that were not major petroleum consumers in the 1970s have rapidly

---

<sup>2903</sup> 83 FR at 43213.

increased their share of consumption, and continue to do so. A more globalized market means that risk of price spikes is spread around—making the U.S. in particular less likely to bear a disproportionate burden of price spikes. The NPRM also discussed the decreasing energy intensity of the U.S. economy over time and the improving balance of payments in petroleum, including the likelihood that the U.S. is poised to become a net petroleum exporter in the near future. Related to the decreasing energy intensity of the U.S. economy, on the demand side, the NPRM discussed the proliferation of fuel-efficient vehicle options in the market in response to CAFE increases over time, and the fact that consumers who wish to purchase more fuel efficient vehicles have largely done so, and may continue to do so over time if they wish.

On the supply side, the NPRM explained, vast increases in U.S. petroleum production, largely from shale formations, have introduced a major new stable supply into the global market. Shale oil production costs may be higher than the cost (for example, to OPEC members) to produce traditional oil, but that itself acts as a lever on global prices. Prices of goods like oil are affected by demand and supply—given that global demand trends increase relatively steadily, if OPEC States want to increase revenues by selling more of the total oil consumed globally, they have to try to control global supply volume by controlling production volumes (to avoid shale production increasing in response to higher prices). In short, the higher global prices trend, the more U.S. shale production increases in response, and as supply increases, prices fall. The NPRM discussed the responsiveness of U.S. shale production and suggested it could be higher than traditional producers in some instances. Traditional oil producers seeking to maintain market share have a new incentive to keep prices below a certain threshold, and U.S supply helps to buffer the impact of geopolitical events. The NPRM looked at then-current EIA oil price forecasts, under which U.S. gasoline prices were not forecast to exceed \$4/gallon through 2050,

and acknowledged that while price shocks could still occur, NHTSA tentatively concluded that from the supply side, it is possible that the oil market conditions that created the price shocks in the 1970s may no longer exist.

In light of these changes in global oil markets, the NPRM tentatively concluded that many aspects of the need of the U.S. to conserve energy had improved enough over time to merit further consideration of what the need of the United States is to conserve oil today and going forward. With regard to environmental considerations, the NPRM returned to the definition of “to conserve” and suggested that differences of thousandths of a degree Celsius in 2100 resulting from higher levels of carbon dioxide emissions under the proposal as compared to the augural standards might not rise to the level of “wasteful,” given the other considerations discussed. With regard to consumer costs, the NPRM discussed the interplay of oil market conditions with prior arguments about consumer “myopia” with regard to the benefits of fuel savings, and tentatively concluded that U.S. consumers may be valuing fuel savings appropriately and purchasing the vehicles they want to purchase—i.e., that using CAFE standards as a tool to compel consumers to save money may not be necessary.

Given the discussion above, NHTSA tentatively concluded that the need of the U.S. to conserve energy may no longer function as assumed in previous considerations of what CAFE standards would be maximum feasible. In that discussion, NHTSA stated that the overall risks associated with the need of the U.S. to conserve oil have entered a new paradigm with the risks substantially lower today and projected into the future than when CAFE standards were first issued and in the recent past. NHTSA explained that the effectiveness of CAFE standards in reducing the demand for fuel combined with the increase in domestic oil production have contributed significantly to the current situation and outlook for the near- and mid-term future.

NHTSA tentatively concluded that the world has changed, and the need of the U.S. to conserve energy, at least in the context of the CAFE program, has also changed.

Of two other factors under 32902(g), the NPRM explained that the changes were perhaps less significant. NHTSA suggested that all of the alternatives appear as though they could narrowly be considered *technologically* feasible, in that they could be achieved based on the existence or the projected future existence of technologies that could be incorporated on future vehicles. With regard to the effect of other motor vehicle standards of the Government on fuel economy, the NPRM explained that it was similarly not heavily limiting during this rulemaking time frame. The NPRM analysis projected that neither safety standards nor Tier 3 compliance obligations appeared likely to make it significantly harder for industry to comply with more stringent CAFE standards, and that EPA's CO<sub>2</sub> standards should have no greater effect on difficulty in meeting CAFE standards than already existed.

For economic practicability, the NPRM considered the traditional definition used by the agency, and expressed concern that all of the alternatives considered in the proposal could raise economic practicability concerns. NHTSA stated that it believed there could be potential for unreasonable elimination of consumer choice, loss of U.S. jobs, and a number of adverse economic consequences under nearly all if not all of the regulatory alternatives considered in the NPRM. NHTSA explored consumer choice issues given a foreseeable future of relatively low fuel prices and the likelihood that more stringent CAFE standards could cause automakers to add technology to new vehicles that consumers do not want, or prevent the addition of technology to new vehicles that consumers do want, and suggested that there could be risk that such elimination of consumer choice could be unreasonable. NHTSA explained its assumption, based on repeated manufacturer input, that fuel-saving technologies that paid for themselves within 2.5

years would be added regardless of CAFE stringency, meaning that the power of CAFE standards (by themselves) to compel fuel savings was reduced. NHTSA suggested that requiring more technology to be added than consumers were willing to pay for could have dampening effects on vehicle sales, particularly given forecasted relatively low gas prices, increasing the likelihood of automaker non-compliance with more stringent standards due to difficulty in selling higher-fuel-economy models. NHTSA examined the levels of electrification necessary to meet the various regulatory alternatives evaluated in the NPRM and compared them with information about consumers' willingness to purchase vehicles with these technologies and even to spend money on fuel economy improvements generally. NHTSA suggested that if the market for higher fuel-economy vehicles exists and is already possibly saturated, increasing fuel economy requirements could create economic practicability concerns by affecting sales and consumer choice.

NHTSA recognized that automakers cross-subsidize regulation-driven cost increases and expressed concern about their ability to do that under sustained, ongoing increases over many years, and the corresponding concern that continued cross-subsidizing could create affordability problems for lower-income consumers if manufacturers pass costs forward to consumers more broadly rather than concentrating them in high-volume, higher-profit vehicles. NHTSA suggested that higher vehicle prices and monthly vehicle payments could outweigh, for at least some new vehicle purchasers, the benefit of fuel savings, because vehicle payments are fixed costs and fuel costs may be less fixed. NHTSA expressed concern that as vehicles get more expensive in response to higher CAFE standards, it will become more and more difficult for finance companies and dealers to continue creating loan terms that keep monthly payments low and do not result in consumers' still owing significant amounts of money on the vehicle by the

time they can be expected to be ready for a new vehicle. This situation may imply a bubble in new vehicle sales, the effects of which could fall disproportionately on new and low-income buyers. NHTSA suggested that these effects could impact both fleet-wide safety (by slowing fleet turnover) and consumer choice. The NPRM also expressed concern that the sales and employment analyses were unable to capture (1) the risk that manufacturers and dealers may not be able to continue keeping monthly new vehicle payments low, or (2) the risk that manufacturing could shift overseas as manufacturing costs rise.

NHTSA also examined the net benefits of the various regulatory alternatives, and noted that the analysis showed that consumers recoup only a portion of the costs associated with increasing stringency under all of the alternatives, because the fuel savings resulting from each of the alternatives was substantially less than the costs associated with the alternative, meaning that net savings for consumers improved as stringency decreased. NHTSA explained that it recognized that this was a significantly different analytical result from the 2012 rule, which showed the opposite trend, and explained that the result was different because the facts and analysis underlying the result were also different, and enumerated the noteworthy differences, such as payback assumptions; fleet composition; what levels of technologies had already been applied; the costs and effectiveness values for some of those technologies; fuel price forecasts; the value of the rebound effect; the value of the social cost of carbon; accounting for price impacts on fleet turnover; not limiting mass reduction to only the largest vehicles; and the value of a statistical life having increased. NHTSA explained that all of these changes, together, meant that the standards under any of the regulatory alternatives (compared to the preferred alternative) were more expensive and had lower benefits than if they had been calculated using the inputs and assumptions of the 2012 analysis. This assessment, in turn, contributed to the agency's

decision to reevaluate what standards might be maximum feasible in the model years covered by the rulemaking. NHTSA explained that it had thus both relied on new facts and circumstances in developing the proposal and reasonably rejected prior analyses relied on in the 2012 final rule.<sup>2904</sup>

NHTSA then considered that “maximum feasible” may change over time as the agency assessed the relative importance of each factor that Congress requires it to consider, and tentatively concluded that proposing CAFE standards that hold the MY 2020 curves for passenger cars and light trucks constant through MY 2026 would be the maximum feasible standards for those fleets and would fulfill EPCA’s overarching purpose of energy conservation in light of the facts before the agency and as the agency expected them to be in the rulemaking time frame. NHTSA recognized that this was a different interpretation from the 2012 final rule and explained that the context of that rulemaking was meaningfully different from the current context, because the facts had changed the importance of the need of the U.S. to conserve energy, and NHTSA recognized that under that circumstance, while more stringent standards may be possible, insofar as production-ready technology exists that the industry could physically employ to reach higher standards, it was not clear that higher standards would be economically practicable in light of current U.S. consumer needs to conserve energy. Therefore, NHTSA stated, it viewed the determination of maximum feasible standards as a question of the appropriateness of standards given that their need—either from the societal-benefits perspective in terms of risk associated with fuel price shocks or other related catastrophes, or from the

---

<sup>2904</sup> See *FCC v. Fox Television Stations*, 556 U.S. at 514-515; see also *NAHB v. EPA*, 682 F.3d 1032 (D.C. Cir. 2012).

private-benefits perspective in terms of consumer willingness to purchase new vehicles with expensive technologies that may allow them to save money on future fuel purchases—seems likely to remain low for the foreseeable future. NHTSA also considered the effects of the standards on highway safety and expressed concern that because more stringent standards could depress sales and slow fleet turnover, and because higher fuel economy leads to more driving and more exposure to crash risk, all regulatory alternatives would improve safety as compared to the augural standards.

b) *What Comments did NHTSA Receive Regarding How it Balanced the Factors in the NPRM?*

In addition to comments on each of the factors NHTSA considered discussed above, comments also were received on how NHTSA should balance these factors in determining the maximum feasible final standards. Hundreds of thousands of comments addressed stringency and, thus, the agency's evaluation of what standards were maximum feasible. Most of those focused on the augural standards: many individual commenters supported reducing the stringency of the standards from augural levels—some citing estimates of cost, and some citing concerns about consumer choice. Many comments by other individual commenters supported retaining stringency at augural levels or increasing stringency beyond that level—generally citing concerns about climate change and increased fuel costs under less stringent standards. A few commenters, like CEI, expressly supported the proposal, and even suggested that stringency should be decreased further. Many other commenters, including environmental and consumer groups, health advocacy organizations, and a number of State organizations, argued that the proposal was flawed and/or that the augural standards should be finalized because more stringent

standards help to reduce climate change and address other air quality issues.<sup>2905</sup> The Congressional Tri-Caucus commenters supported maintaining the augural standards, stating that they contribute to employment and protect low income communities and communities of color.<sup>2906</sup>

The Alliance and Global Automakers both supported final standards that increased in stringency year over year. The Alliance stated that it could support stringency increases between 0 percent per year and 2-3 percent per year “along with the inclusion of appropriate flexibilities.”<sup>2907</sup> Global stated that increases should be “meaningful”<sup>2908</sup> and suggested that “[i]n order for the U.S. auto industry to remain competitive and continue to export vehicles to the rest of the world, industry is best served by a reasonable, steady ramp rate that accounts for investments made and the global nature of the market. Steady increases allow for long-term planning and create an environment of security that fosters ongoing investment in vehicle technology and consumer confidence in purchasing new vehicles. It also provides a level playing field upon which automakers can compete.”<sup>2909</sup> Toyota made similar points, and argued that while the standards set in 2012 are beyond maximum feasible today, the “statutes support an adjustment to those standards that reflect the realities of the market, consumer choice, and the pace of technological advancement acceptable to consumers.”<sup>2910</sup> Mazda stated that it supported

“increasing requirements for fuel efficiency..., if they are sensible and achievable under changing market conditions.”<sup>2911</sup>

NADA commented that it was willing to support standards that increased in stringency (i.e., more stringent than the proposal) if they were economically practicable and technologically feasible, based on the evidence before the agencies; if they ensured consumer choice and “the strongest possible rate of fleet turnover;” and if passenger car and light truck standards increased at the same rate.<sup>2912</sup> The Alliance for Vehicle Efficiency (AVE) argued that compliance shortfalls are evidence that the current rate of stringency increase is beyond maximum feasible, and that the assumptions that enabled those rates to be chosen “are no longer feasible based on consumer adoption.”<sup>2913</sup> AVE suggested that a rate of increase of 2.5 percent per year for both cars and trucks, retroactively imposed beginning in MY 2018, would be feasible given sufficient flexibilities.<sup>2914</sup>

NADA also stressed the importance of flexibilities as a compliance tool for meeting standards that increase faster than the proposal.<sup>2915</sup> The Minnesota agencies supported maintaining standards at the augural levels, commenting that automakers has simply “requested additional flexibility..., not a wholesale rollback of the standards,” and suggesting that additional flexibilities would enable augural levels.<sup>2916</sup> IPI disagreed with the suggestion in the NPRM that heavy automaker reliance on credits for compliance might indicate that standards were beyond

<sup>2916</sup> Minnesota agencies, NHTSA-2018-0067-11706, at 6-7.

maximum feasible, arguing that automakers must be either using credits about to expire, or counting on future standards being cheaper to meet due to rising consumer demand for fuel economy, technology costs decreasing over time, and the cost-effectiveness of EPA's EV multiplier incentive.<sup>2917</sup>

With regard to analysis of costs and benefits, IPI argued that the final rule needed, like the 2012 rule, to cite costs and benefit expressly in discussing balancing of statutory factors, but with a "proper" accounting of costs and benefits. IPI claimed that in the NPRM the factors were balanced "in a way that conflicts with the...controlling statute[ ] and weighed...without regard for the accuracy of the accompanying cost-benefit analysis."<sup>2918</sup> IPI stated that "...the agencies' analysis produced biased and irrational results at each of the steps in that causal chain, leading to a Proposed Rule that vastly overstates the benefits of the rollback and understates the benefits society foregoes with the rollback," and that "[a] full and balanced analysis of all the costs and benefits that the agencies are charged with considering would reveal—as the midterm review recently confirmed—that the baseline standards will deliver massive net social benefits, and the proposed rollback is unjustified."<sup>2919</sup>

With regard to net benefits, the States and Cities commenters stated that prior analyses had concluded that the net benefits of the augural standards were extremely high,<sup>2920</sup> while the Alliance stated that "[t]he NERA-Trinity Assessment confirms the Agencies' findings that Alternatives 1, 5, and 8 result in increased net benefits relative to the no-action alternative

augural CAFE standards.”<sup>2921</sup> Michalek and Whitefoot commented that “maximizing net benefits is among the most important factors to consider in policy selection because it is an effort to weigh a variety of policy implications on a common basis and seek decisions that are beneficial to society overall,” but also cautioned that estimates are inherently uncertain and should be transparent and clearly justified; that sensitivity analysis is necessary; that a net benefits analysis will not be able to capture distributional effects or changes in behavior caused by the policy; and that “it is not clear that there is necessarily any relationship between MNB and setting the ‘maximum feasible’ criteria while considering ‘economic practicability.’”<sup>2922</sup> IPI disagreed with the NPRM’s suggestion that feasibility concerns could lead NHTSA not to maximize net benefits, stating that “if a standard were truly not feasible, then its costs would be prohibitively high, and a full and fair cost-benefit analysis would reflect that.”<sup>2923</sup>

CARB argued that “[a]lthough EPCA provides NHTSA with some discretion with respect to balancing the four factors, that discretion is nevertheless constrained by EPCA’s overriding mandate of conserving energy.”<sup>2924</sup> CARB further stated that EPCA “envisio[n]s the promulgation of increasingly stringent requirements to ensure the continued reductions of both emissions and fuel consumption from motor vehicles.”<sup>2925</sup> Michalek and Whitefoot similarly commented that the requirement that standards be maximum feasible necessarily means that stringency must increase over time, because technology capabilities and cost are constantly improving; international regulations are constantly increasing in stringency; and if standards are

<sup>2925</sup> *Id.*, at 80.

held constant, automakers will always exceed them.<sup>2926</sup> The States and Cities commenters cited the *CAS* language from the D.C. Circuit that “[i]t is axiomatic that Congress intended energy conservation to be a long term effort that would continue through temporary improvements in energy availability,” and argued that “[w]hile NHTSA purports to acknowledge this purpose and the importance of improving fuel economy over time, NHTSA proposes to do the opposite: roll back fuel economy standards for a period of at least *six years*.”<sup>2927</sup> The States and Cities commenters further argued that NHTSA had “departed sharply from its past interpretations and practice without an adequate explanation, often without even an acknowledgement,” citing *Fox Television*, insofar as the 2012 final rule justification had noted that less stringent regulatory alternatives would have conserved less energy than the then-finalized standards, as compared to “[w]ith the Proposed Rollback, NHTSA has radically changed positions—assuming energy conservation provides little, if any, benefits, for example—without explaining or even acknowledging this complete reversal of course.”<sup>2928</sup> The States and Cities commenters concluded that it was “impermissible” for NHTSA to balance “the factors in a manner that contravenes EPCA’s central purpose of energy conservation.”<sup>2929</sup>

ACEEE commented that NHTSA did not have discretion to assess whether the need of the U.S. to conserve energy was as great as when EPCA was first passed, arguing that “[t]he statute does not ask for a determination on whether the nation needs to save energy. It assumes the need and directs that the need be taken into account along with other considerations.”<sup>2930</sup>

<sup>2929</sup> *Id.*

<sup>2930</sup> ACEEE, NHTSA-2018-0067-12122, main comments, at 1.

Securing America’s Energy Future commented that the need of the U.S. to conserve energy continued, and that “[a]lthough the nation is undoubtedly more energy secure than it was before the start of the U.S. shale oil revolution ten years ago,”<sup>2931</sup> “[u]ntil the U.S. transportation sector is no longer beholden to oil, the country will be vulnerable to oil price volatility. Improving the fuel efficiency of the U.S. vehicle fleet is a valuable insurance policy against this volatility.”<sup>2932</sup> IPI also commented that fuel efficiency standards act as insurance, but against unpredictable future fuel prices.<sup>2933</sup> IPI stated that anticipating relatively low future fuel prices was not an appropriate basis for finalizing the proposal, both because fuel costs may rise in the future, and also because EPA’s Final Determination “found that that even with the lowest prices projected in AEO 2016 of close to \$2, the ‘lifetime fuel savings significantly outweigh the increased lifetime costs’ of the GHG standards.”<sup>2934</sup> IPI further argued that “[i]n ignoring the [FD] analysis, the Proposed Rule has failed to provide a ‘reasoned explanation’ for dismissing the ‘facts and circumstances that underlay’ the original rule, rendering its analysis arbitrary and capricious.”<sup>2935</sup> IPI also argued that NHTSA had not adequately explained its “shift since 2012 in its interpretation and application of the need to conserve energy factor,” stating that “[a]ctual fuel savings, and the associated benefits to consumers, the environment, and society, were at the heart of NHTSA’s analysis of the need to conserve energy factor back in 2012. Now the agency ignores those conclusions from 2012 and relies on mistaken and inconsistent interpretations of petroleum import projections and the urgency of climate change to justify ignoring this statutory

<sup>2934</sup> *Id.*, at 32.

<sup>2935</sup> *Id.*

factor and giving primacy instead to economic practicability and safety effects. The failure to explain this shift in approach is arbitrary.”<sup>2936</sup>

UCS argued that the need of the United States to conserve energy is “the most important of the four required factors” according to *CBD v. NHTSA*, and claimed that “NHTSA has manipulated the evaluation of the factors to produce a result that supports the preferred option in the NPRM.”<sup>2937</sup> The States and Cities commenters argued that it was “[c]ynical...” for NHTSA to justify the proposal on the basis that “the oil intensity of U.S. GDP has continued to decline” in part as a result of increasingly stringent CAFE standards, and on the basis that “[m]anufacturers have responded to fuel economy standards and to consumer demand over the last decade to offer a wide array of fuel-efficient vehicles in different segments and with a wide array of features.”<sup>2938</sup>

CARB and *CBD et al.* argued that if NHTSA’s analysis indicates that automakers will voluntarily exceed the standards, then the standards cannot be maximum feasible.<sup>2939</sup> Robertson commented relatedly that standards should not be set below augural levels because “Much higher fuel economy and reduced emissions have been achieved by several lower priced makes and models using hybrid technology.”<sup>2940</sup> Blue Planet Foundation stated that the augural standards are feasible because automakers have already invested in technologies, and electrification is projected to continue to grow cheaper over time, so that “even the up-front cost of an EV will

<sup>2940</sup> Robertson, EPA-HQ-OAR-2018-0283-0787, at 3.

begin to reach parity with gas-powered cars by 2024.”<sup>2941</sup> ACEEE also cited the voluntary overcompliance in the NPRM analysis as evidence that there could not be diminishing returns from higher fuel efficiency standards, because “the list of [cost-effective] technology [must] continually regenerate itself” if manufacturers would continue applying it in the absence of future standards. Moreover, ACEEE argued, past analyses had always found plenty of available cost-effective technologies, and automakers would find a way to apply them.<sup>2942</sup>

c) *How is NHTSA Balancing the Factors to Determine the Maximum Feasible Final CAFE Standards?*

EPCA/EISA grants the Secretary (by delegation, NHTSA) discretion in how to balance the relevant statutory factors, while bearing in mind EPCA’s overarching purpose of energy conservation. Many commenters cited the Ninth Circuit’s language in *CBD v. NHTSA* that “the overarching purpose of EPCA is energy conservation,”<sup>2943</sup> and the D.C. Circuit’s language in *CAS v. NHTSA* that “[i]t is axiomatic that Congress intended energy conservation to be a long term effort that would continue through temporary improvements in energy availability.”<sup>2944</sup> NHTSA has considered those comments and those court decisions carefully as it made the decision set forth in the final rule. Based on the information before the agencies and considering carefully the comments received, NHTSA has determined that the preferred alternative identified in the proposal—amending the MY 2021 standards to match MY 2020, and holding those standards flat through MY 2026—does not represent the maximum feasible standards, and that

---

<sup>2941</sup> Blue Planet Foundation, EPA-HQ-OAR-2018-0283-4207, at 1-2.

<sup>2942</sup> ACEEE, NHTSA-2018-0067-12122, main comments, at 9.

<sup>2943</sup> *CBD*, 508 F.3d 508, 537 (9<sup>th</sup> Cir. 2007), opinion vacated and superseded on denial of reh’g, 538 F.3d 1172 (9<sup>th</sup> Cir. 2008).

<sup>2944</sup> *CAS*, 793 F.2d 1322, 1340 (D.C. Cir. 1986).

the maximum feasible standards for MYs 2021-2026 passenger cars and light trucks increase in stringency by 1.5 percent per year from the MY 2020 standards. The following discussion walks through NHTSA's evaluation and balancing of the relevant factors in light of the information before it.

*(1) Need of the U.S. to Conserve Energy*

NHTSA agrees with commenters that energy conservation remains important, and that changed conditions, even significantly changed conditions, do not obviate NHTSA's obligation to set maximum feasible CAFE standards as directed by Congress. Many commenters disagreed strongly with NHTSA's suggestion in the NPRM that increased U.S. petroleum production, and the U.S.'s likely imminent status as a net petroleum exporter, decreased the need of the U.S. to conserve energy. NHTSA agrees that there is still a need to conserve energy, and oil in particular. Like an insurance policy or a savings account, continuing to move the needle forward on CAFE helps position Americans better to weather certain types of possible future uncertainty. NHTSA believes that it is reasonable to be somewhat conservative about this risk, and thus to set CAFE standards that increase in stringency year over year through MY 2026.

That said, NHTSA believes that there are limits to how much uncertainty the CAFE program can mitigate—continuing to make progress is important, but it is also important to be transparent and realistic about what is being accomplished, even if NHTSA were able to set standards beyond levels that NHTSA considers maximum feasible. NHTSA also continues to believe that structural changes in global oil markets over the last 10 years, driven in part by changes in demand both in the U.S. and abroad, and in part by the significant growth in U.S. petroleum production, have led to a fundamental shift in the dynamics of global oil prices, which

has in turn improved U.S. (and possibly, global) energy security. NHTSA believes that this shift is important to consider as NHTSA weighs the need of the Nation to conserve energy.

NHTSA acknowledges that price shocks can still happen. The large scale attack on Saudi Arabia's Abqaiq processing facility—the world's largest crude oil processing and stabilization plant—on September 14, 2019 caused “the largest single-day [crude oil] price increase in the past decade,” of between \$7 and \$8, according to EIA.<sup>2945</sup> The Abqaiq facility has a capacity to process 7 million barrels per day, or about 7 percent of global crude oil production capacity. By September 17, however, also according to EIA,

Saudi Aramco reported that Abqaiq was producing 2 million barrels per day, and they expected its entire output capacity to be fully restored by the end of September. In addition, Saudi Aramco stated that crude oil exports to customers will continue by drawing on existing inventories and offering additional crude oil production from other fields. Tanker loading estimates from third-party data sources indicate that loadings at two Saudi Arabian export facilities were restored to the pre-attack levels. Likely driven by news of the expected return of the lost production capacity, both Brent and WTI crude oil prices fell on Tuesday, September 17.<sup>2946</sup>

Thus, the largest single-day oil price increase in the past decade was largely resolved within a week, and assuming very roughly that average crude oil prices were \$70/barrel in September 2019 (slightly higher than actual), an increase of \$7/barrel would represent a 10 percent increase as a result of the Abqaiq attack. Contrast this with the 1973 Arab oil embargo, which lasted for months and raised prices 350 percent.<sup>2947</sup> Saudi Arabia could have benefited, revenue-wise, from higher prices following the Abqaiq attack, but instead moved rapidly to restore production

---

<sup>2945</sup> <https://www.eia.gov/todayinenergy/detail.php?id=41413>.

<sup>2946</sup> *Id.*

<sup>2947</sup> See Jeanne Whalen, “Saudi Arabia’s oil troubles don’t rattle the U.S. as they used to,” *Washington Post*, September 19, 2019, available at <https://www.washingtonpost.com/business/2019/09/19/saudi-arabias-oil-troubles-dont-rattle-us-like-they-used/>.

and tap reserves to *control* the risk of resulting price increases, likely recognizing that long-term sustained price increases would reduce their ability to control global supply (and thus prices, and thus their own revenues) by relying on their lower cost of production.<sup>2948</sup> Even if the NPRM discussion was perhaps overconfident about the ability of U.S. shale producers to act as “swing” supply, as some commenters suggested, it seems clear from events that the *existence* of U.S. production has a stabilizing effect on global oil prices. This has played out in important ways in the first quarter of 2020, with the dissolution of the “OPEC+” coalition as Russia and Saudi Arabia compete for market share in response to U.S. shale production and also in the wake of global demand downturn.<sup>2949</sup>

Even though the effect of significant supply disruptions appears much lower than was the case several years ago, the analysis for this final rule (like the NPRM analysis) does, in fact, explicitly account for the possible occurrence of price shocks. The cost penalty used in the analysis to represent the consequences of those shocks attempts to quantify the negative impact on U.S. GDP created by abrupt, short-term increases in the world oil price. The values used in the NPRM were based on arguably outdated work, and commenters cited more recent studies of relevance in their comments on the NPRM – one of which formed the basis for the estimates in

<sup>2949</sup> See, e.g., EIA, “This Week in Petroleum – OPEC shift to maintain market share will result in global inventory increases and lower prices,” March 11, 2020, <https://www.eia.gov/petroleum/weekly/>; DOE, “DOE Responds to Recent Oil Market Activity,” March 9, 2020, <https://www.energy.gov/articles/doe-responds-recent-oil-market-activity>; Reid Standish, Keith Johnson, “No End in Sight to the Oil Price War Between Russia and Saudi Arabia,” March 14, 2020, <https://foreignpolicy.com/2020/03/14/oil-price-war-russia-saudi-arabia-no-end-production/>; Alex Ward, “The Saudi Arabia-Russia oil war, explained,” March 9, 2020, <https://www.vox.com/2020/3/9/21171406/coronavirus-saudi-arabia-russia-oil-war-explained>.

today's analysis. The final rule estimate of this cost are based on a recent study which states that "[i]n recent years, the United States has become much more self-reliant in producing oil, and a newer economics literature suggests that oil demand may be more elastic and U.S. GDP may be less sensitive to world oil price shocks than was previously estimated. These developments suggest somewhat lower security costs may be associated with U.S. oil consumption."<sup>2950</sup> These more recent studies concede that the fact that "the world has not seen a major oil supply disruption since 2003," and that therefore "we have no reliable method to quantify the effects of these disruptions,"<sup>2951</sup> but even the range of uncertainty suggests that the risk has decreased relative to prior estimates. The price shock cost estimate employed in the NPRM was at least twice as large as the upper bound of the range in Brown's new estimates, and consistently close to the upper bound of the range of his more conservative estimates. The approach taken today, which relies on median estimates in Brown's study, implies that risk is more properly estimated here than in the NPRM.

Commenters (Bordoff, SAFE, CARB, IPI) argued that increased U.S. petroleum production, which improves the stability of the global supply and reduces the probability of supply interruptions, does not reduce U.S. exposure to petroleum price shocks, which are still determined by the dynamics of the global market. By reducing the probability of supply disruptions in the global market, the U.S. does reduce its vulnerability to price shocks. However, to the extent that the vulnerability to price shocks is a function of *exposure*, commenters are correct that looming petroleum independence does not entirely insulate the U.S. economy from

---

<sup>2950</sup> Brown, Stephen, "New estimates of the security costs of U.S. oil consumption," Energy Policy 113 (2018) 171-192, at 171. Cited in Securing America's Energy Future, NHTSA-2018-0067-12172, at 29.

<sup>2951</sup> Brown, at 181.

the consequences of global oil price shocks. Some commenters further argued that the proposed standard would leave the U.S. more exposed to oil price shocks, which would harm consumers. Basic mathematics means that a less efficient on-road fleet necessarily would spend more on fuel than a more efficient on-road fleet in the event of a sudden, unexpected, and dramatic increase in oil price. The suggestion in these comments, however, is that finalizing the augural standards would sufficiently insulate U.S. consumers from harm during such an event, while finalizing any other regulatory alternative would not. NHTSA disagrees that finalizing the augural standards, as compared to the standards we are finalizing, would make a meaningful difference in this case.

A continuous, but slow, price increase over several years is fundamentally different from the kinds of acute price shocks over which commenters have expressed understandable concern. Long-term price increases signal consumers to make investments in fuel economy, in both the new and used vehicle markets, and to diversify the vehicles in their household fleets. In a side analysis using outputs from the CAFE Model, the agencies examined the consequences of a gasoline price spike in 2030—increasing the price from \$3.40/gallon to \$6/gallon for eight months, then reverting back to \$3.40/gallon.<sup>2952</sup> By choosing a year so far in the future, the agencies consider a larger gap in fleet fuel efficiency than is attributable to this action. If the agencies increase stringency again after MY 2026, the efficiency gap between the on-road fleet in the final standards and baseline would be smaller than simulated here. This side analysis showed that even a nearly doubling of the fuel price, sustained for more than half a year, would result in less than 1 percent savings in fuel expenditures for that year under the final standards (relative to the proposal), compared to about 5 percent reduction in expenditures under the

---

<sup>2952</sup> Docketed in NHTSA-2018-0067.

augural standards. This demonstrates that even though finalizing the augural standards would mitigate American drivers' increase in fuel expenditures by more than the standards the agencies are finalizing today, it would only do so by a few percent. This is important to understanding concerns about differences in the amount of fuel saved under today's final standards versus if the augural standards were finalized, as will be discussed more below. And as also discussed below, NHTSA believes the augural standards are beyond maximum feasible at this time.

Some commenters raised the possibility that the U.S. might ban fracking at some point in the future, and suggested that therefore the need of the U.S. to conserve energy could not be assumed away. NHTSA acknowledges that the future is uncertain. Without the supply of U.S. oil in the global market, NHTSA agrees that it is foreseeable that conditions could revert somewhat to how global oil market conditions were before the ramp-up in U.S. supply—i.e., that the global market as a whole could be somewhat less stable and thus fuel prices could be somewhat more prone to change unexpectedly and for longer periods. Pulling out of the market on the supply side means that the agencies would lose the ability to influence the market on that side. Presumably, part of the policy objective of banning fracking would be to accelerate a transition to a post-oil transportation system. In that scenario, presumably decision-makers would consider higher fuel prices to be an acceptable tradeoff for less driving and lower emissions. That said, the availability of shale oil resources does exist today, and is not realistically in question. And, even if the future availability of that capacity was realistically doubtful, any increase in fuel economy above current levels, like the final rule will require, will help somewhat to mitigate the economic pain to drivers of that event were it to occur, as shown

above.<sup>2953</sup> To the extent that current events cause pauses or consolidation in the shale industry’s development, while that may lead to transitory difficulty for the shale industry, the resources will continue to exist, and U.S. shale will continue to be able to act as a lever to keep global prices from rising very high for very long.

As noted above, Securing America’s Energy Future commented that “[a]lthough the nation is undoubtedly more energy secure than it was before the start of the U.S. shale oil revolution ten years ago,”<sup>2954</sup> “[u]ntil the U.S. transportation sector is no longer beholden to oil, the country will be vulnerable to oil price volatility. Improving the fuel efficiency of the U.S. vehicle fleet is a valuable insurance policy against this volatility.”<sup>2955</sup> (Emphasis added.) NHTSA agrees fully with this comment. Energy security concerns were the driving force behind the creation of the CAFE program, as discussed in the NPRM. U.S. energy security has improved, but the only way to resolve petroleum-related energy security concerns entirely would be for the U.S. vehicle fleet to stop using oil. And doing so would not avoid energy-related concerns entirely, but rather shift them away from petroleum (and the Middle East) and toward battery-related security (and lithium-, nickel-, cobalt-, and other metals-producing countries).<sup>2956</sup>

<sup>2956</sup> While progress is being made on developing and improving domestic sources for many of the minerals necessary for battery development, the U.S. is still heavily dependent on imports of both raw materials and batteries. Regarding minerals production and import dependence, see Schulz, K.J., DeYoung, J.H., Jr., Seal, R.R., II, and Bradley, D.C., eds., *Critical mineral resources of the United States – Economic and environmental geology and prospects for future supply*: U.S. Geological Survey Professional Paper 1802 (see particularly Chapter K, p. K1-K21 on lithium), available at [https://www.commerce.gov/sites/default/files/2020-01/Critical\\_Minerals\\_Strategy\\_Final.pdf](https://www.commerce.gov/sites/default/files/2020-01/Critical_Minerals_Strategy_Final.pdf) and <https://pubs.usgs.gov/pp/1802/k/pp1802k.pdf>. Regarding vehicle battery supply chains, see Coffin, D., and J. Horowitz, “The Supply Chain for Electric Vehicle Batteries,” *Journal of*

Our relationship to the global energy market has changed significantly since the CAFE program was created, with most of this change occurring over the last decade. The United States has become energy independent, and is currently a net exporter of petroleum products. Rising world oil prices no longer only mean a financial burden on U.S. drivers and a wealth transfer to foreign nations. While rising prices continue to affect U.S. motorists, we have taken steps to insulate our transportation system from exogenous price shocks. CAFE standards (and, recently, CO<sub>2</sub> standards) have increased the efficiency of new vehicles for more than a decade, and these increasingly efficient vehicles are still working their way into the on-road fleet as older models are retired. Accompanying any increase in the global oil price is an increase in revenue to the U.S. oil industry. To the extent that motorists are spending more on oil everywhere, the dollars spent on domestically produced petroleum products stay within the U.S. and additional revenue from foreign buyers flows into our domestic energy industry. To the extent that the U.S. transportation system is able to further reduce its dependence on petroleum in a cost-effective manner, it is sensible to do so. But in the current environment, in which motorized transportation is increasingly energy efficient and U.S. energy producers are not only supplying our demand but exporting petroleum products to other nations, the nationwide benefits of reducing petroleum consumption are substantially diminished.

There is also the opposite concern to bear in mind—that energy security is not just about oil becoming more expensive, but also about other changes in oil prices. Major fluctuations in either direction, as well as oil price collapse, can potentially have seriously destabilizing

*International Commerce and Economics*, December 2018, available at [https://www.usitc.gov/publications/332/journals/the\\_supply\\_chain\\_for\\_electric\\_vehicle\\_batteries.pdf](https://www.usitc.gov/publications/332/journals/the_supply_chain_for_electric_vehicle_batteries.pdf).

geopolitical effects. Many major oil producing countries (some of whom are allies) rely heavily on oil revenues for public revenue, and sustained losses in public revenue in certain countries and regions can foreseeably create new energy-related security risks, not only for the U.S. As the world works toward transitioning away from oil for transportation, keeping prices reasonably stable may best help that transition remain peaceful and steady. In short, energy security can cut both ways, and the current estimates of price shock that we model inherently do not account for the longer-term stabilizing effect of steady global oil consumption (of which the U.S. is a part) on global security. Steady trends in consumption can facilitate steady changes in production, which can facilitate a steady security situation.

NHTSA does not interpret EPCA/EISA to mean that Congress expected the CAFE program to take the U.S. auto fleet off of oil entirely—indeed, EISA renders doing so impossible because it amended EPCA to prohibit NHTSA from considering the fuel economy of dedicated alternative fuel vehicles, including electric vehicles, when setting maximum feasible standards. This means that standards cannot be set that assume increased usage of full electrification for compliance. Reading that prohibition together with the obligation to set maximum feasible standards by considering (which is hard to do without balancing) factors like economic practicability with the need of the U.S. to conserve energy, NHTSA believes that Congress intended CAFE to try to mitigate the risk of gas lines, but not to shift the fleet entirely off of oil. Moreover, the EISA-added requirement that standards “increase ratably” for MYs through 2020 ceases to apply beginning in MY 2021. While NHTSA unquestionably has discretion to determine that standards should continue to increase post-MY 2020, NHTSA does not interpret EPCA/EISA as *requiring* that they do, as long as they are maximum feasible. Several commenters suggested that standards that do not continue to increase, by definition, cannot be

maximum feasible, but NHTSA believes that this interpretation does not account for the clear requirement that maximum feasible standards be determined with reference to the four statutory factors. The statute does not preclude an interpretation that non-increasing standards could be maximum feasible, depending on the facts before the agency. Neither does the statute preclude an interpretation that amending standards downward can be maximum feasible, as has occurred in the past in response to changes in consumer demand.<sup>2957</sup>

Nevertheless, for purposes of this final rule, NHTSA does believe that standards that increase in stringency are maximum feasible; the question remains by how much those standards should increase. While NHTSA agrees that CAFE standards must conserve energy, the improvement in energy security discussed above is entirely relevant to *how much energy should be conserved*. If the marginal improvement in energy security of increasing CAFE stringency from one regulatory alternative to another is very small, as it appears to be based on the above discussion, then other aspects of the need of the U.S. to conserve energy must be considered next to see what effect they have.

Consumer costs, as discussed above, is another aspect of the need of the U.S. to conserve energy. The final rule analysis estimates that all alternatives besides the baseline/augural standards would result in higher fuel costs for consumers than the baseline/augural standards would result in, as follows:

\*Rounded to nearest \$25

A number of commenters stated that the 2012 rulemaking had relied on fuel savings as part of its justification, and argued that the NPRM had not adequately grappled with the fact that the proposal would have cost consumers more in fuel expenditures than if NHTSA finalized the augural standards. In fact, NHTSA explained in the NPRM that while fuel costs would be higher, NHTSA believed that the higher upfront (and ongoing, if financed) costs of new vehicles and associated taxes and registration fees—as well as the opportunity cost associated with those upfront costs—would outweigh, for many consumers, the additional fuel costs that would be incurred if standards were less stringent than augural. That continues to be the case under the final rule analysis, as discussed below. In addition, Section VI.D. discusses how past rulemaking analyses assumed that consumers were ‘myopic’ and/or did not have adequate information about the benefits of fuel savings, which led them to choose to purchase less efficient vehicles than they otherwise would if they better understood the costs or savings they would accrue. As Section VI.D. explains, the agencies are less certain today that consumers improperly value fuel savings. Vehicle buyers today have more information about fuel costs than ever before,

including right on the window sticker when considering a new vehicle purchase, and it is ultimately a private choice whether consumers prefer improvements in other vehicle attributes over additional fuel economy. When fuel costs are expected to rise manageably over time, it may be that consumers are comfortable choosing to absorb an additional \$1,375 over the vehicle's lifetime, the estimated difference in lifetime expenditures between the proposal and if NHTSA was choosing to finalize the augural standards, and are even more comfortable choosing to absorb an additional \$1,125, the estimated difference in lifetime expenditures between the final standards and what the augural standards would have required. If fuel prices rise less than anticipated, as they have done since the 2012 final rule, or even decrease over time, buyers face an even smaller tradeoff between foregone fuel savings and the value of improvements in other aspects of new cars.

Consumer expenditures on fuel are important to understanding the benefits (and net benefits) of CAFE and CO<sub>2</sub> standards. Every analysis of CAFE/CO<sub>2</sub> standards relies on hundreds of assumptions, and estimates of costs and benefits developed as part of those analyses, by their very nature, depend on those assumptions. Specifically, the net benefits associated with each alternative result from the assumptions used and the relationships between vehicle production, ownership, and usage in which the assumptions interact. Put more simply, inputs affect outputs. As discussed in the section above on economic practicability, net benefits may be a consideration in the determination of maximum feasible standards, among the many other things the agency considers. While some commenters have asserted that the analysis for this rulemaking has “put a thumb on the scale by undervaluing the benefits and overvaluing the costs

of more stringent standards,”<sup>2958</sup> this final rule has identified a number of critical assumptions in the 2012 final rule that were problematic in the other direction (i.e., undervaluing the costs and overvaluing the benefits), for a variety of reasons. For example, the projected fuel prices in the 2012 analysis inflated the value of fuel savings relative to what has actually occurred. That assumption about how fuel prices were projected to rise over time was solidly grounded at the time, but is no longer so, and continuing to use it would not be reasonable, even if that means that the benefits of all of the regulatory alternatives decrease as compared to what the 2012 analysis showed. Lower oil prices mean that fuel savings benefits for consumers are lower under any CAFE standards, whether the augural standards or the standard being finalized today—consumers may yet spend less on fuel under more stringent standards, but *how much less* matters.

Additionally, the assumption in 2012 that no market exists for fuel economy improvements at any fuel price or technology cost artificially inflated the value of fuel savings attributable to the standards in each regulatory alternative. The combination of assumptions and relationships (the examples above, and others) in the 2012 final rule produced estimates of net benefits that continued to increase with stringency from 1 percent per year through 6 percent per year.<sup>2959</sup> Under some alternatives, benefits actually would have appeared to be infinite, growing faster than the discount rate, if the analysis had been extended far enough into the future. No market works this way, and there is no reasonable set of assumptions under which costs could *never* exceed benefits no matter how much technology was deployed or how much stringency

---

<sup>2958</sup> See *CBD v. NHTSA*, 538 F.3d 1172, 1189 (9<sup>th</sup> Cir. 2008).

<sup>2959</sup> The 7 percent per year alternative happened to be indistinguishable from the 6 percent alternative in that analysis.

was required. Rather than demonstrating meaningfully that more stringent standards are always more beneficial to society, the result from the 2012 analysis suggests that that analysis was critically flawed. That said, while the 2012 analysis appeared to show that more technology, at a faster pace, is always preferable from the perspective of net benefits, the agencies ultimately relied on other features of the analysis and considerations of impacts in choosing a preferred alternative. While today's analysis produces an inflection point at a 3 percent discount rate—a level of stringency where further increases reduce net benefits as the tradeoff between regulatory costs and resulting net benefits tips the other way<sup>2960</sup>—the agencies similarly rely on considerations beyond net benefits in choosing the preferred alternative.<sup>2961</sup>

NHTSA also agrees with many commenters that environmental (both climate and air quality) concerns are relevant to the need of the U.S. to conserve oil, as explained above. As the Supreme Court stated in *Massachusetts v. EPA*, “[a] reduction in domestic emissions would slow the pace of global emissions increases,”<sup>2962</sup> and there is no question that CAFE standards directly affect CO<sub>2</sub> emissions. Besides providing information on differences between the regulatory alternatives in terms of million metric tons of CO<sub>2</sub> emitted, the NPRM also provided a chart illustrating the difference between the estimated atmospheric CO<sub>2</sub> concentration (789.76 ppm) in 2100 under the proposal as compared to the estimated level under the augural standards (789.11 ppm) in a scenario where no CO<sub>2</sub> emissions reduction measures are implemented throughout the planet.<sup>2963</sup> The NPRM noted that this translated to 3/1000ths of a degree Celsius increase in

---

<sup>2960</sup> See Table VII-95.

<sup>2961</sup> See *CBD v. NHTSA*, 538 F.3d 1172, 1188 (9<sup>th</sup> Cir. 2008).

<sup>2962</sup> *Mass. v. EPA*, 549 U.S. at 526.

<sup>2963</sup> 83 FR at 42996-97 (Aug. 24, 2018).

global average temperatures by 2100, relative to the augural standards. Many commenters strongly objected to the framing of these findings, as discussed above in the section on the environmental implications of the need of the U.S. to conserve energy. Changing the framing does not change the agency’s findings.<sup>2964</sup> For this final rule, the Preferred Alternative would result in 922.5 million metric tons of CO<sub>2</sub> more than the estimated emissions if the augural standards were to be finalized (for MY 2017 – MY 2029 vehicles between calendar years 2017 and 2070), which is 160.2 million fewer tons than if the proposed Preferred Alternative were to be finalized. It is reasonable to consider these raw million-metric-ton estimates in terms of their effects, namely, on estimated temperature change and sea level rise, which are the primary climate effects referred to and estimated. The FEIS accompanying today’s rule estimates that, by 2100, global mean surface temperature will increase by 3.487 degrees (Celsius) under either the proposed or final standards, versus 3.484 degrees under the augural standards. The FEIS shows corresponding sea level rise in 2111 reaching 76.34 cm under the final standards, 76.35 cm under the proposed standards, and 76.28 cm under the augural standards. This is accounted for in economic terms (i.e., translated from fractions of a degree temperature rise and from millimeters of sea level rise, among other things, into dollar-based effects) in the measure of the social cost of carbon, described in Section VI.D.1.b)(13).

NHTSA is mindful of the language in *Massachusetts v. EPA* that “[a]gencies . . . do not generally resolve massive problems in one fell regulatory swoop,”<sup>2965</sup> and acknowledges the concerns of many commenters that standards less stringent than augural may result in higher CO<sub>2</sub>

---

<sup>2964</sup> In fact, NHTSA’s analysis in Section 8.6.4.2 of the FEIS illustrates that the differences between alternatives are similar in reference to other GCAM scenarios. Regardless of whether there will be widespread global efforts to mitigate climate change, the impacts of this action are roughly the same.

<sup>2965</sup> *Mass. v. EPA*, 549 U.S. at 524.

emissions. In response, it is important to remember that even under the proposal, sales of new vehicles would, over time, have continued to improve the fuel economy and reduce the CO<sub>2</sub> emissions of the on-road fleet through fleet turnover effects, as discussed in Section IV. Under the final rule, those rates of improvement will likely be faster than they would have been if NHTSA were finalizing the proposal. Emissions are still being reduced under the final rule, and the on-road fleet will be less energy and carbon intensive than it is today. NHTSA is taking the impacts of CO<sub>2</sub> emissions into account, while also considering the other statutory factors in its balancing.

It is also important to note that the science of climate change and the models used to assess effects on climate variables (and other effects discussed in Section VII.A.4.b, and in the DEIS/FEIS) are subject to various types and degrees of uncertainty. In light of this, NHTSA also conducted climate sensitivity analyses in the FEIS.<sup>2966</sup> In these analyses, NHTSA considered a range of climate sensitivities (1.5°C, 2.0°C, 2.5°C, 3.0°C, 4.5°C, and 6.0°C) for a doubling of CO<sub>2</sub> compared to preindustrial atmospheric concentrations (278 ppm CO<sub>2</sub>). Even under the least stringent alternative considered (the proposal) and assuming the highest level of climate sensitivity (6.0°C), the global mean surface temperature increase in 2100 was 0.006°C higher than under the augural standards. Thus, accounting for some of this uncertainty, impacts on global mean surface temperature resulting from this action remain very small.

NHTSA received many comments about the costs of delaying CO<sub>2</sub> emissions reductions and the potential of crossing climate tipping points and triggering abrupt climate change. Many

---

<sup>2966</sup> See Sections 5.4.2.3 and 8.6.4.2 of the FEIS.

of these costs and risks are factored in to the social cost of carbon, and are therefore considered as part of the agency's cost-benefit analysis. And many of these costs and risks cannot be quantified at all: the current state of science does not allow for quantifying how increased emissions from a specific policy or action might affect the probability and timing of abrupt climate change. However, NHTSA does recognize that while these costs cannot be quantified, they do exist and must also be taken into account. Ultimately, the costs of delaying CO<sub>2</sub> emissions reductions (both the ones that can be accounted for quantitatively and those that can only be considered qualitatively) must also be balanced against the costs associated with more stringent alternatives. Some of the costs associated with more stringent alternatives are direct, such as the additional costs passed on to consumers for technology that improves fuel economy. Other costs are indirect, such as environmental costs associated with more stringent fuel economy standards. For example, the increased electrification of motor vehicles can result in localized impacts associated with the production and recycling of lithium-ion batteries. Similarly, the increased reliance on material substitution for vehicle mass reduction could result in various environmental impacts associated with manufacture and recycling. Certainly, the benefits of these technologies in reducing carbon emissions outweighs the other life-cycle environmental impacts, but that does not mean NHTSA can just ignore those impacts, either.

Many commenters claimed that NHTSA ignored the effects of climate change or determined they were inevitable, not urgent enough to act upon, or not worth the effort to address at all. NHTSA makes none of those determinations here. On the contrary, NHTSA has considered the material on this subject in the administrative record and the plethora of public comments we received on the topic. The agency recognizes what is at stake, but we also recognize that NHTSA is not charged by Congress to single-mindedly address carbon emissions

at the expense of all other considerations. The question before NHTSA is not whether to conserve energy (and thereby reduce carbon emissions, which drive climate change) but by how much each year. Taking climate change into account elevates the importance of the “need of the United States to conserve energy” criterion in NHTSA’s balancing. However, in light of the limits in what the agency can achieve, the potential offsetting impacts to the environment, and the statutory requirement to consider other factors, the impacts of carbon emissions alone cannot drive the outcome of NHTSA’s decision-making.

NHTSA also recognizes the potential impacts of this rulemaking on air quality. To be clear, this final rule does not directly involve the regulation of pollutants such as carbon monoxide, smog-forming pollutants (nitrogen oxides and unburned hydrocarbons), or “air toxics” (e.g., formaldehyde, acetaldehyde, benzene). Nevertheless, NHTSA recognizes that this rule is expected to impact such emissions indirectly (by reducing travel demand and accelerating fleet turnover to newer and cleaner vehicles on one hand while, on the other, increasing activity at refineries and in the fuel distribution system). Based on a review of Section VII.A.4.c. above and the FEIS, NHTSA believes these impacts are much smaller than impacts on fuel use and CO<sub>2</sub> emissions, and therefore factor in less to the need of the U.S. to conserve energy.<sup>2967</sup>

For criteria pollutants, NHTSA estimates that emissions over the lifetimes of vehicles through MY 2029 under the alternatives will not change significantly. Tailpipe emissions of most pollutants will generally decrease, while upstream emissions will generally increase. Overall emissions under the action alternatives for most pollutants will increase over time.

---

<sup>2967</sup> For an explanation of how NHTSA considers environmental impacts and the differences between the preamble and FEIS analyses, *see* Section VII.A.4.c.1 above.

Changes are not uniform year-to-year, however, reflecting the complex interaction of the amount of highway travel, the distribution of that travel among different vehicles, upstream processes, etc. Generally, tailpipe air toxic emissions decrease while upstream air toxic emissions increase. Over the long term, however, the upstream emissions increase further while the decreases in tailpipe emissions become less pronounced. Overall, NHTSA anticipates that air toxic emission will increase over time under the action alternatives. Most alternatives result in cumulative increases in adverse health impacts associated with total upstream and tailpipe pollutant emissions. Although some alternatives would have resulted in decreases, the differences among alternatives across the lifetime of vehicles through MY 2029 are not large.

NHTSA also considered the various impacts reported qualitatively in the FEIS and described briefly above in Section VIII.B.3. Although the agency cannot compare the impacts of the alternatives quantitatively (except to the degree that they are otherwise covered by the agency's monetary cost-benefit analysis, such as through the social cost of carbon), NHTSA recognizes that such impacts would generally increase under all the action alternatives compared to the augural standards. In Chapter 8 of the FEIS, for example, NHTSA provides a qualitative discussion of the long-term impacts of climate change on key natural and human resources. While these impacts would be expected to increase under the action alternatives, the change is expected to be very small. In contrast, the FEIS also discusses some environmental impacts that would decrease with the lower stringencies considered in this rulemaking. For example, in Chapter 6 of the FEIS, NHTSA provides a literature review of potential lifecycle impacts as a result of manufacturer use of various materials and technologies to meet the standards. NHTSA can account for the benefits to tailpipe emissions of these technologies as part of its evaluation of technology effectiveness. However, as discussed in the FEIS, accounting for the upstream

emissions associated with the processes used in the manufacture of these technologies can be complicated. Because the adoption of these materials and technologies would vary across alternatives, and each has varying upstream impacts, the agency cannot provide meaningful comparisons across alternatives. Still, any benefit to tailpipe CO<sub>2</sub>, criteria pollutant, or air toxic emissions of more stringent alternatives would be offset by the increased upstream impacts reported in that section.<sup>2968</sup>

In total, environmental impacts factor into the need of the U.S. to conserve energy and potentially elevate that criterion, but those impacts cannot be considered in isolation. While some impacts are more significant than others, NHTSA must consider how much weight to place on this factor as well as the relative weight of other factors.

Thus, even if the agency no longer interprets the need of the U.S. to conserve energy as necessarily boundless as it once did, as it explained in the NPRM and again in the discussion above, NHTSA continues to believe that the factor functions in the overall balancing to push toward increases in stringency, and notes that any increase in stringency over the last binding standards—not in question at this point, the standards for MY 2020—does conserve energy and reduce negative environmental impacts. In fact, fleet turnover over time means that less energy is being consumed by the fleet over time even if standards did *not* increase year over year. Even if new vehicles are not all as efficient as would have been required under more stringent standards, they are still more efficient on average than the older vehicles they are replacing,

---

<sup>2968</sup> In most cases, tailpipe emissions benefits offset upstream environmental impacts associated with materials and technologies NHTSA considered in its analysis. However, in some cases, results may not align with conventional wisdom. For example, while EVs can offer significant life-cycle GHG emissions savings over conventional vehicles, this is highly dependent on the time and location of charging. In some regions, life-cycle impacts are similar for EVs and conventional vehicles.

particularly after a decade of successive increases in CAFE standard stringency, as Section IV above discusses. The on-road fleet has well over 250 million vehicles, dwarfing the roughly 16 million new vehicles sold each year. Comprehensive energy savings come from turning over legacy vehicles in the fleet so that overall fleet fuel economy increases. If the NPRM's preferred alternative were finalized, the fuel consumption of the passenger car and light truck fleet would have fallen from roughly 8.5 million barrels per day (currently) to roughly 7 million barrels per day by 2050 as the fleet turned over. Finalizing the 1.5 percent alternative reduces that number to 6.3 million barrels per day. That breaks the trend of increasing oil consumption over time, and conserves energy.

*(2) Technological Feasibility and the Effect of Other Motor Vehicle Standards of the Government on Fuel Economy*

As in the 2012 final rule, technological feasibility and the effect of other motor vehicle standards of the Government on fuel economy do weigh in NHTSA's balancing of the relevant factors, but they play a less significant role because they vary less across regulatory alternatives than the other factors vary. Technological feasibility, as explained above and as similarly explained in 2012, relates to whether technologies exist and can be commercially applied during the rulemaking timeframe. None of the regulatory alternatives under consideration today would require brand new technologies to be invented – they can all be met with technology that exists currently. However, as recognized in the 2012 final rule, “some technologies that currently have limited commercial use cannot be deployed on every vehicle model in MY [2021], but require a realistic schedule for widespread commercialization to be feasible. ...Any of the alternatives could thus be achieved on a technical basis alone if the level of resources that might be required to implement the technologies is not considered.” As explained above in the discussion of

economic practicability, however, resources must be, and are, considered. The 2012 final rule further explained that “If all alternatives are at least theoretically technologically feasible in the [rulemaking] timeframe, and the need of the nation is best served by pushing standards as stringent as possible, then the agency might be inclined to select the alternative that results in the very most stringent standards considered.” The 2012 final rule stated, however, that such a selection would be inappropriate because “the agency must also consider what is required to practically implement technologies, which is part of economic practicability, and to which the most stringent alternatives give little weight.”

NHTSA considers technological feasibility similarly to how it has long considered that factor—for the most part, the question of what standards are maximum feasible is less about technological feasibility than about economic practicability. All of the regulatory alternatives considered in this final rule are likely technologically feasible, but that does not mean that any of them could be maximum feasible, just as we concluded in evaluating alternatives in 2012. NHTSA must now account for how the need of the U.S. to conserve oil has changed, and this consideration tips our balancing away from the most stringent standards.

For the effect of other motor vehicle standards of the Government on fuel economy, there is relatively little variation across regulatory alternatives, as discussed in the FRIA. As in the 2012 final rule, in developing this final rule NHTSA considered the effects of compliance with known and possible NHTSA safety standards and known EPA emission standards in developing this final rule, and has accounted for those effects in the analysis. The effect of other motor vehicle standards of the Government does not, therefore, have a noticeable effect on NHTSA’s balancing of factors to determine maximum feasible standards.

(3) *Economic Practicability*

Economic practicability remains a complex factor to consider and balance, as discussed above, encompassing a variety of different issues that are each captured to various degrees through the analysis. As NHTSA stated in the 2012 final rule, “The agency does not necessarily believe that there is a bright-line test for whether a regulatory alternative is economically practicable, but there are several metrics . . . that we find useful for making the assessment.”<sup>2969</sup> In 2012, as today, NHTSA looks to factors like:

- Per-vehicle cost, in terms of “even if the technology exists and it appears that manufacturers can apply it consistent with their product cadence, if meeting the standards will raise per-vehicle cost more than we believe consumers are likely to accept, which could negatively impact sales and employment in this sector, the standards may not be economically practicable”;<sup>2970</sup>
- Application rate of technologies, because “even if shortfalls are not extensive, whether it appears that a regulatory alternative would impose undue burden on manufacturers in either or both the near and long term in terms of how much and which technologies might be required” can be relevant to manufacturers’ difficulty with meeting standards;<sup>2971</sup>

---

<sup>2969</sup> 77 FR at 63038 (Oct. 15, 2012).

<sup>2970</sup> *Id.*

<sup>2971</sup> *Id.*

- Consumer demand, which NHTSA described in 2012 as “other ... considerations related to the application rate of technologies, whether it appears that the burden on several or more manufacturers might cause them to respond to the standards in ways that compromise ... other aspects of performance that are important to consumer acceptance of new products”,<sup>2972</sup>
- Manufacturer compliance shortfalls, because “If it appears, in our modeling analysis, that a significant portion of the industry cannot meet the standards defined by a regulatory alternative in a model year, given that our modeling analysis accounts for manufacturers’ expected ability to design, produce, and sell vehicles (through redesign cycle cadence, technology costs and benefits, etc.), then that suggests that the standards may not be economically practicable”<sup>2973</sup>;
- Uncertainty and consumer acceptance of technologies, which the 2012 final rule said was “not accounted for expressly in our modeling analysis, but [was] important to an assessment of economic practicability given the time frame of this rulemaking.”<sup>2974</sup>

Thus, estimated impacts on per-vehicle cost are one issue; estimated sales and employment impacts are issues; uncertainty surrounding future market conditions and consumer demand for fuel economy (versus consumer demand for other vehicle attributes) are other issues. Consumers may respond to per-vehicle cost increases by choosing to keep their current vehicle or buy used

---

<sup>2972</sup> *Id.*

<sup>2973</sup> *Id.*

<sup>2974</sup> *Id.*

vehicles instead of new vehicles, with consequent effects on new vehicle sales and the overall fleet makeup; consumers may respond to new fuel-economy-improving technologies on certain models by choosing to buy other models, especially when fuel costs are not expected to increase significantly in the ownership timeframe and consumers value other vehicle attributes more than they value fuel economy. Either of these responses may cause manufacturers both to lose money and to face further difficulties in meeting the CAFE standards. While there are significant benefits for both manufacturers and consumers under attribute-based standards, manufacturers must still sell enough “target-beaters” to balance out sales of less-fuel-efficient vehicles and meet their overall fleet-average compliance obligations. If consumer demand shifts strongly away from target-beaters, CAFE compliance will be a struggle, even if the target-beaters are widely available. Section IV above discusses this phenomenon in more detail. And if consumers buy fewer new vehicles in response to per-vehicle cost increases, which the agencies are beginning to see already,<sup>2975</sup> the fleet as a whole will turn over more slowly, and fuel conservation gains may also be slowed. NHTSA does not believe that that is EPCA’s goal. Manufacturers struggling to sell new vehicles will have less capital to devote to further technological improvements; may choose to move manufacturing jobs outside the U.S. to places with lower labor costs; and so forth. A net benefits analysis may be informative to attempting to quantify some of the issues described above, but not all of these issues lend themselves to clear quantification. The following discussion will evaluate what the agencies believe has been reasonably accounted for.

---

<sup>2975</sup> See, e.g., Jackie Charniga, “Prime buyers flood used-vehicle market in Q4,” *Automotive News*, March 4, 2020, <https://www.autonews.com/finance-insurance/prime-buyers-flood-used-vehicle-market-q4>.

*(a) Per-Vehicle Costs, Sales, and Employment as Part of Economic Practicability*

Per-vehicle cost estimates are relevant to NHTSA’s consideration of economic practicability because, when cost increases associated with more stringent standards are passed through to consumers as price increases, they affect consumers’ willingness and ability to purchase new vehicles, and thus influence vehicle sales and fleet turnover. A similar effect occurs in reverse when stringency is decreased. Table VIII-7 below shows the estimated effects on per-vehicle costs by regulatory alternative in MY 2029:

**Table VIII-7 – Average Regulatory Costs (beyond MY 2017) in MY 2029**

Scenario Name	Passenger Cars	Light Trucks	Combined
Augural Cafe Standards	2,325	3,275	2,775
0.00%/Y Pc And 0.00%/Y Lt During 2021-2026	1,350	1,425	1,375
0.50%/Y Pc And 0.50%/Y Lt During 2021-2026	1,375	1,450	1,400
1.50%/Y Pc And 1.50%/Y Lt During 2021-2026	1,475	1,825	1,650

1.00%/Y Pc And 2.00%/Y Lt During 2022-2026	1,600	2,300	1,925
2.00%/Y Pc And 3.00%/Y Lt During 2021-2026	1,650	2,400	2,000
2.00%/Y Pc And 3.00%/Y Lt During 2022-2026	1,775	2,750	2,225

\*Rounded to nearest \$25

Generally speaking, per-vehicle costs increase as stringency increases. The agencies estimate that, by MY 2029, costs for additional fuel-saving technology (beyond that present on vehicles in MY 2017) would average about \$2,800 under the augural CAFE standards, as compared to about \$1,400 under the proposed CAFE standards, and about \$1,650 under the final CAFE standards for MYs 2021-2026. The next most stringent alternative beyond the 1.5 percent alternative is the “2%/3%” alternative. Under 2%/3%, the agencies estimate that costs would increase by \$2,000 per vehicle on average. NHTSA understands that many readers may not find

an extra \$350 per vehicle to be a compelling reason to reject the 2%/3% alternative, or even find an additional \$1,125 per vehicle a reason to reject the baseline/augural standards. As the NPRM discussed, "...the corresponding up-front and monthly costs may pose a challenge to low-income or credit-challenged purchasers. ...such increased costs will price many consumers out of the market—leaving them to continue driving an older, less safe, less efficient, and more polluting vehicle, or purchasing another used vehicle that would likewise be less safe, less efficient, and more polluting than an equivalent new vehicle."<sup>2976</sup> This continues to be a concern: for example, the average MY 2025 prices estimated here under the baseline, final, and 2%/3% CAFE standards are about \$38,100, \$36,850, and \$37,150, respectively. The buyer of a new MY 2025 vehicle might thus avoid the following purchase and first-year ownership costs under the final standards as compared to the baseline standards or 2%/3% standards:

**Table VIII-8 - Example Calculations of Transactional Costs Associated with New Vehicle Purchases Under Baseline, Final, and 2%/3% Standards**

	Due at purchase					Monthly				
	Baseline	Final	2%/3%	Savings Final vs. Baseline	Savings Final vs. 2%/3%	Baseline	Final	2%/3%	Savings Final vs. Baseline	Savings Final vs. 2%/3%
Down payment <sup>2977</sup>	4,458	4,311	4,347	147	36					
Taxes and fees	2,080	2,012	2,028	68	16					
Loan payments						558	539	544	19	5
Collision and comp.						58	56	57	2	1
Total	6,538	6,323	6,375	215	52	616	595	601	21	6

<sup>2976</sup> 83 FR at 43222 (Aug. 24, 2018).

<sup>2977</sup> Edmunds estimates that the average down payment for a new vehicle in 2019 was 11.7% of the vehicle's price, see <https://www.edmunds.com/car-buying/how-much-should-a-car-down-payment-be.html>

	Due at purchase					Monthly				
	Baseline	Final	2%/3%	Savings Final vs. Baseline	Savings Final vs. 2%/3%	Baseline	Final	2%/3%	Savings Final vs. Baseline	Savings Final vs. 2%/3%
Total (68 months)	6,538	6,323	6,375	215	52	41,888	40,460	40,868	1,428	408

While the buyer of the average vehicle would also purchase somewhat more fuel under the final standards than the baseline standards, this difference might average less than four gallons per month during the first year of ownership. Some purchasers may consider it more important to avoid these very certain (e.g., being reflected in signed contracts) cost savings than the comparatively uncertain (because, e.g., some owners drive considerably less than others, and may purchase fuel in small increments as needed) fuel savings. For some low-income purchasers or credit-challenged purchasers, the cost savings may make the difference between being able or not to purchase the desired vehicle. As vehicles get more expensive in response to higher CAFE standards, it will get more and more difficult for manufacturers and dealers to continue creating loan terms that both keep monthly payments low and do not result in consumers still owing significant amounts of money on the vehicle by the time they can be expected to be ready for a new vehicle. These considerations were discussed in the NPRM and they remain true for this final rule.

Per-vehicle cost and fuel economy both affect sales estimates in the final rule analysis. Table VIII-9 below shows the estimated effects on fleet-wide sales by regulatory alternative from 2017-2030, where the augural standards represent absolute sales and all other alternatives represent increases relative to the augural sales:

**Table VIII-9 – Estimated Sales Impacts by Alternative**

<b>Total</b>	<b>228,176,995</b>	<b>3,579,671</b>	<b>3,503,652</b>	<b>3,040,338</b>	<b>2,967,978</b>	<b>2,275,973</b>	<b>2,219,481</b>	<b>1,609,746</b>

The final rule analysis indicates that industry sales decrease as stringency increases, and increase as stringency decreases. While sales under both the proposal and the final rule are comparable, each represents about a 1.5 percent reduction in total sales over the period from 2017 – 2030. In the context of 16-17 million new vehicle sales annually, NHTSA does not believe that the sales volume effects here, while significant, are necessarily determinative for economic practicability, even after accounting for fuel economy effects in the sales analysis as some commenters recommended. That said, NHTSA recognizes that the final rule sales analysis does not account for a number of factors that could cause differences between alternatives to result in changes in new vehicle sales (perhaps greater). For example, as explained above, NHTSA remains concerned that significant increases in fixed upfront prices (which for many people translate to monthly financing costs) are harder for certain segments of new vehicle buyers to manage than fuel costs, which can be managed to some extent through vehicle switching or travel decisions. The sales analysis for this final rule indicates that more stringent standards tend to result in higher light truck sales and lower passenger car sales. While NHTSA does not have specific information (or a vehicle choice model) to inform the agency about which consumers (by income) buy which vehicles, and while NHTSA acknowledges that it does not account for price cross-subsidization by manufacturers to keep “entry-level” new vehicle (often, passenger car) prices low, NHTSA continues to be concerned about the possibility of a bubble in the market for new vehicles. As the Wall Street Journal reported in November 2019, “Some 33% of people who traded in cars to buy new ones in the first nine months of 2019 had negative equity, compared with 28% five years ago and 19% a decade ago, according to car-shopping site Edmunds.... Rising car prices have exacerbated an affordability gap that is increasingly getting

filled with auto debt.”<sup>2978</sup> The sales analysis for this final rule does not directly account for these effects, but NHTSA is concerned that they may be considerable. NHTSA notes that this analysis does not take into account potential economic turmoil or recession, which may have a significant impact on vehicle sales and industry viability.<sup>2979</sup>

The final rule analysis also looked at employment effects under the different regulatory alternatives. A number of commenters argued that more stringent standards improved employment opportunities, as shown in the NPRM analysis and in other analyses, due to the need for workers to manufacture the additional technology needed to meet those more stringent standards. Similar to the NPRM analysis, the agencies’ updated analysis shows labor utilization, on balance, increasing slightly with stringency, as this effect outweighs the opposing effect of changes in vehicle sales. Table VIII-11 below shows the estimated effects on U.S. auto industry employment by regulatory alternative in MY 2029:

**Table VIII-10 - Estimated Industry Labor Utilization in 2029**

Scenario Name	Person Years
Augural Cafe Standards	1,203,232
0.00%/Y Pc And 0.00%/Y Lt During 2021-2026	1,185,903
0.50%/Y Pc And 0.50%/Y Lt During 2021-2026	1,185,778
1.50%/Y Pc And 1.50%/Y Lt During 2021-2026	1,189,758
1.00%/Y Pc And 2.00%/Y Lt During 2021-2026	1,190,486
1.00%/Y Pc And 2.00%/Y Lt During 2022-2026	1,194,963
2.00%/Y Pc And 3.00%/Y Lt During 2021-2026	1,196,318
2.00%/Y Pc And 3.00%/Y Lt During 2022-2026	1,199,720

<sup>2978</sup> AnnaMaria Andriotis and Ben Eisen, “A \$45,000 Loan for a \$27,000 Ride: More Borrowers are Going Underwater on Car Loans,” Wall Street Journal, November 9, 2019.

<sup>2979</sup> Letter from Alliance for Automotive Innovation, NADA, and MEMA to Congress, Mar. 23, 2020, available at <https://www.autosinnovate.org/wp-content/uploads/2020/03/COVID-19-Letter-to-Congress-NADA-MEMA-AAI-March-23.pdf>.

It is important to note, however, that the reduction in person-years described in this table merely reflects the fact that, when compared to the standards set in 2012, fewer jobs will be specifically created to meet infeasible regulatory requirements. It is also important to note that the \$15 billion in avoided required technology costs (in MY 2029) can be invested by manufacturers into other areas, or passed on to consumers. Moreover, consumers can either take those cost savings in the form of a reduced vehicle price, or used toward the purchase of specific automotive features that they desire (potentially including a more-efficient vehicle or optional safety features that can reduce risk of injury or death for all vehicle occupants on the road), which would increase employment among suppliers and manufacturers.

Generally speaking, the agencies' analysis shows net labor utilization increasing with stringency, because the additional labor utilization involved with producing additional fuel-saving technology outweighs the foregone labor utilization involved with the foregone sales. As indicated above, for the scope of labor utilization accounted for in today's analysis, the agencies show about 1.20 million person-years under the augural CAFE standards and about 1.19 million person-years under either the proposed or final standards. As for sales, it is arguably instructive to consider these estimates in the broader context of U.S. employment. BLS data indicates that roughly 129 million people in the U.S. are employed full-time at the time of writing,<sup>2980</sup> and that roughly 1.4 million people were employed in motor vehicle and motor vehicle equipment manufacturing in 2018.<sup>2981</sup> The agencies estimate that, compared to the augural standards, the final standards will reduce automotive labor utilization associated with production of the MY

---

<sup>2980</sup> <https://www.bls.gov/cps/cpsaat08.htm>.

<sup>2981</sup> <https://www.bls.gov/cps/cpsaat18b.htm>.

2029 fleet by about 1.1%, a slightly smaller reduction than the 1.4% estimated to occur under the proposed standards. For comparison, the Synapse Report cited often by commenters concluded that vehicle standards result in “nationwide employment increases of more than 100,000 in 2025 and more than 250,000 in 2035...these increases represent less than 0.2 percent of current U.S. employment levels.”<sup>2982</sup> Even at these levels, which NHTSA does not necessarily agree are accurate, the employment effects of standards are in the range of the average of more than 216,000 jobs added to the U.S. economy *during each month* of 2018.<sup>2983</sup> That said, as for sales, NHTSA recognizes that the final rule labor utilization analysis does not account for a number of factors that could cause differences between alternatives to be different (perhaps greater), as discussed further below.

*(b) Application Rates for New Technologies as Part of  
Economic Practicability*

The sales analysis for this final rule also does not account for the potential consumer acceptance issue of more stringent standards effectively requiring the application of technologies not yet ready for widespread deployment. As widely noted, the 2012 rule assumed extremely high penetration of dual-clutch transmissions in response to standards. While the agencies stated throughout that final rule that the analysis was not meant to represent the expected response to the standards, Ford did apply DCTs to a number of vehicle models in its fleet, that resulted in major customer satisfaction issues and ultimately caused extensive buyback campaigns,

---

<sup>2982</sup> <https://www.synapse-energy.com/sites/default/files/Cleaner-Cars-and%20Job-Creation-17-072.pdf>, at ES-2.

<sup>2983</sup> Payroll employment increased by 2.6 million jobs in 2018, an average of 216,667 per month. “The Employment Situation – December 2018,” Bureau of Labor Statistics, available at: [https://www.bls.gov/news.release/archives/empsit\\_01042019.pdf](https://www.bls.gov/news.release/archives/empsit_01042019.pdf).

customer service programs, and class-action litigation.<sup>2984</sup> Sales can be impacted as a result of standards if technologies applied in response to those standards have operational, maintenance, or customer acceptance problems, or if consumers are unwilling to pay for it. Manufacturer capital to develop and add new technologies and manage these rollout issues is finite, as discussed. Insufficient capital can also cause quality problems. The cost effects modeled in this final rule analysis, that drive the sales and scrappage analyses, only include technology costs and RPE—they do not include the cost of stranded capital or lost consumer surplus, which are things that could drive up costs, drive down benefits, and therefore impact sales and scrappage beyond what today’s analysis shows.

As Section IV above notes, a great deal of fuel economy-improving technology has already been added to the fleet since 2012, which means that the amount of fuel economy-improving technology left to be added in response to higher standards is less than it was assumed to be in 2012. Looking at the technology penetration rates modeled in today’s analysis, it appears that the augural standards are projected to require nearly 20 percent total electrification in MY 2029, while the proposal would have required nearly 7 percent and the final standards would require nearly 8 percent. Table VIII-11 below shows projected electrification rates by 2029 for the regulatory alternatives—electrification refers to all models with strong hybrids, PHEVs, or full EVs:

**Table VIII-11 – Electrification Rates by Alternative**

<b>Scenario Name</b>	<b>Strong Hybrid</b>	<b>Plug-In Hybrid</b>	<b>BEV</b>	<b>Total</b>
Augural Cafe Standards	12.4%	6.5%	0.6%	19.6%

<sup>2984</sup> See <https://www.autonews.com/technology/dual-clutch-gearbox-complaints-haunt-ford>.

Scenario Name	Strong Hybrid	Plug-In Hybrid	BEV	Total
0.00%/Y Pc And 0.00%/Y Lt During 2021-2026	4.4%	1.8%	0.7%	6.9%
0.50%/Y Pc And 0.50%/Y Lt During 2021-2026	4.4%	1.9%	0.7%	6.9%
1.50%/Y Pc And 1.50%/Y Lt During 2021-2026	5.3%	1.9%	0.7%	7.9%
1.00%/Y Pc And 2.00%/Y Lt During 2021-2026	5.0%	1.9%	0.7%	7.6%
1.00%/Y Pc And 2.00%/Y Lt During 2022-2026	7.0%	2.4%	0.7%	10.0%
2.00%/Y Pc And 3.00%/Y Lt During 2021-2026	6.7%	2.5%	0.7%	9.9%
2.00%/Y Pc And 3.00%/Y Lt During 2022-2026	8.0%	3.4%	0.7%	12.1%

As the table shows, the analysis projects that meeting the augural standards could require over twice as much electrification as the final rule standards could require.<sup>2985</sup> The current market penetration for all such vehicles is only approximately 4 percent even though the technology is well-established, with hybrids having been first introduced with the Honda Insight in 1999 and Toyota Prius in 2000, plug in hybrids with the Chevrolet Volt in late-2010 and electric vehicles with the Tesla Roadster in 2008 and Nissan Leaf in late 2010. As Mr. Kreucher commented, and as Figure VIII-2 shows, consumers appear to be driven by fuel price. Given anticipated fuel prices during this timeframe and evidence in the market today of cannibalization within these vehicle segments (not to mention the continued phasing out of government incentives for these vehicles),<sup>2986</sup> NHTSA is concerned that there could be consumer acceptance

---

<sup>2985</sup> While NHTSA is prohibited by statute from considering battery electric vehicles as a compliance mechanism, we are aware that many OEMs will likely opt to produce a smaller number of fully electric vehicles rather than a large number of strong hybrid models.

<sup>2986</sup> 26 U.S.C. Section 30D provides for tax credits ranging from \$2,500 to \$7,500 for purchasers of qualifying plug-in hybrid (PHEV) and battery electric (BEV) vehicles, with a phaseout applying to vehicle manufactured by an automaker once they sell 200,000 qualifying vehicles. Both Tesla and General Motors have reached this threshold and the tax credit applicable to purchasers of new PHEV and BEV vehicles from those manufacturers has been reduced gradually and will phase out completely on January 1, 2020 for Tesla, and April 1, 2020 for General Motors.

The California Clean Vehicle Rebate Project was launched in 2010 to provide incentives of up to \$5,000 for purchasers or lessees of qualifying PHEV, BEV, and certain other alternative fuel vehicles. Since then, the program

problems associated with further electrification under more stringent alternatives, which could have sales impacts.

We underscore that the table above simply shows the analytical results of the modeling for today's final rule based upon the most cost-effective means of achieving a given standard— it does *not* show how manufacturers would, or could, comply with the CAFE standards represented by the different regulatory alternatives. The discussion below covers the topic of manufacturer compliance shortfalls, and this discussion and that one are connected: the final rule analysis does not show significant compliance shortfalls under any regulatory alternative, but NHTSA believes that this is in large part because the CAFE model is not programmed with assumptions about consumer acceptance of strong hybrid technologies. In effect, the model lets manufacturers lean on hybridization to achieve compliance at a lower cost than if manufacturers instead pursued, for example, more advanced engine technologies. If cost-effectiveness is the only concern, that may be a valid compliance choice. If consumer acceptance of hybrid vehicles is accounted for, especially in a time of foreseeably low fuel prices, it may not be a valid compliance choice.

---

has undergone significant changes, including the addition of income eligibility criteria for certain incentives, and excluding eligibility toward the purchase or lease of a vehicle with an MSRP exceeding \$60,000.

Separately, in 2005, California passed a law allowing hybrid electric vehicle (HEV), plug in hybrid electric vehicle (PHEV), and battery electric vehicle (BEV), and other qualifying alternative fuel vehicle owners to apply for a sticker allowing single-occupant access to High Occupancy Vehicle (HOV) lanes. HEV access was phased out in 2011, with eligibility being limited to PHEV, BEV and other qualifying alternative fuel vehicle owners. Access is now limited to a four-year period, and only to individuals who do not receive a rebate under the California Clean Vehicle Rebate Project (unless meeting income eligibility requirements).

**Figure VIII-2 – Strong Hybrid Market Share and U.S. Fuel Prices**

As Figure VIII-2 illustrates, the market share of strong hybrids in the new vehicle market has mostly tracked fuel prices. The bars represent the market share (left axis) and the line tracks the price of fuel (on the right axis). The light numbers inside of each bar represent the number of unique strong hybrid models offered for sale in that year. Initially, we see rapid growth that continues during the fuel price increases of the mid-2000s and peaking at around 3.5 percent market share. The figure shows that neither the passage of time, where consumers become more familiar with the technology over successive vehicle purchases, nor the number of models offered for sale have much of an impact on the market share for strong hybrids. Despite a doubling of the number of models offered for sale in subsequent years, market share continued to track fuel price closely, and fell dramatically as prices fell in 2015 and 2016. At fuel prices at or above \$3.50/gallon, strong hybrids were able to capture additional market share. However, the

current projection does not show prices returning to those levels for quite some time – leaving manufacturers uncertain about their ability to sell strong hybrids in the numbers estimated to be needed to comply with CAFE and CO<sub>2</sub> standards before MY 2026.

The agencies conducted a sensitivity analysis to evaluate the impact of compliance pathways that did not rely on strong hybrids (see Chapter 7 of the Final RIA). As we discuss in the sensitivity analysis, in the absence of strong hybrids, compliance pathways tend toward a greater reliance on advanced engines and transmissions, and more aggressive exploitation of opportunities to reduce vehicles' mass. These alternative technology pathways carry with them additional technology costs that increase compliance costs in the baseline and increase the savings associated with the preferred alternative.

Under the CAFE program, where battery electric vehicles are not a compliance option (due to statutory restrictions on their consideration for rulemaking), the additional cost of advanced engine technology in the baseline increases baseline technology cost by about \$800 per vehicle, and increases the cost savings under the preferred alternative, which has a much smaller reliance on strong hybrids to achieve compliance, by about \$600 per vehicle. This difference is sufficient to change the sign on net social benefits for the preferred alternative to being slightly negative, to being very positive (nearly \$80 billion at a 3 percent discount rate). The magnitude of this impact is comparable to the impact of varying fuel price projections.

As shown in, Figure VIII-2 even the preferred alternative requires levels of strong hybridization (and PHEV share) that would be about twice what has been observed at the market, even at its peak. Both the baseline and the 2%/3% alternative have even greater reliance on hybridization – more than twice as much in the baseline. The compliance costs associated with

each alternative in today's rule depend upon the estimated levels of hybridization in the compliance scenarios being possible to achieve in the new vehicle market. The sensitivity analysis shows that manufacturers can still reach comparable levels of fuel economy without additional reliance on hybridization, but at significantly higher per-vehicle costs. Those higher costs have implications for the sales response, vehicle retirement rates in the existing vehicle population, and the penetration rate of emerging safety features.

*(c) Consumer Demand as Part of Economic  
Practicability*

As discussed above, NHTSA's consideration of consumer demand as relevant to economic practicability has been upheld by the D.C. Circuit in *Center for Auto Safety v. NHTSA*. A number of commenters argued that consumers do, in fact, demand more fuel economy than the NPRM analysis assumed; that consumers will appreciate more widespread application of fuel economy-improving technologies that NHTSA appears to believe they will tolerate; that NHTSA was wrong to assume that fuel prices will remain relatively low in the future and continue to dampen consumer demand for fuel economy; and that vehicle manufacturers will not make tradeoffs between investments in fuel economy improvements and investments in other vehicle characteristics which consumers also demand, such that requiring manufacturers to meet more stringent standards will not impair consumer demand for new vehicles because less of those other characteristics will be available. Those commenters also often highlighted the *CAS* language stating that consideration of consumer demand may not undermine EPCA's goal of energy conservation.

NHTSA agrees with commenters that some consumers seek out vehicle models with higher fuel efficiency, and notes that those consumers have increasing numbers of relatively high-efficiency vehicle models to choose from in the current new-vehicle market, as shown in the previous section. CAFE does not affect fuel economy improvements that are supported by consumer demand—market forces will take care of that. Instead, it specifically addresses fuel economy improvements that are *not* preferred by consumers, and the agency sets standards that require manufacturers to make fuel economy improvements that consumers are not otherwise seeking. Section IV.B.3 discusses at some length the fact that alternative powertrains and higher fuel-efficiency vehicle models have proliferated widely since 2011—consumers no longer lack for choice if fuel economy is what they want. NHTSA’s concern regarding consumer demand is that in an era of relatively low gasoline prices—as EIA currently projects and NHTSA has no basis to second-guess, and which may be even lower than currently projected—it does not appear likely that the market for higher fuel-economy vehicles and alternative powertrains in particular will increase significantly in the rulemaking timeframe, beyond the 30-month payback period that the agencies currently use as a proxy for market demand for fuel economy. It is worth citing the *CAS* case at greater length here in light of its parallels: as the D.C. Circuit stated in that case,

[T]he petitioners do not challenge the consideration of consumer demand per se, but rather the weight the agency has given the factor in downgrading standards when, they argue, the principal impracticability is paying a civil penalty [*note: today, using or purchasing credits*]. Until the model years at issue here, there has been little tension between consumer demand and the fuel conservation goals of EPCA. The agency now relies on market projections in a setting in which falling gas prices have relaxed consumer demand for fuel efficiency. Earlier consideration of consumer demand in setting standards could not have alerted Congress to the agency's current application of this factor. Because Congress has not spoken clearly on the issue before us, it must be determined whether the agency's interpretation represents a reasonable accommodation of the policies embodied in the statute.

...

The agency concluded that if manufacturers had to restrict the availability of larger trucks and engines in order to adhere to CAFE standards, the effects “would go beyond the realm of 'economic practicability' as contemplated in the Act.”[Citation omitted.] The original projections of technological feasibility for the 1985 model year standards were based on the assumption that gasoline prices would remain high and consumer demand for fuel-efficient vehicles would remain strong. No one disputes that actual circumstances have deviated from these assumptions. NHTSA acted within the reasonable range of interpretations of the statute in correcting the 1985 standards to account for these changed conditions. Consideration of product mix effects was also reasonable in setting the standards for 1986, as there is no evidence that the same trends in consumer demand will not continue.

...

In short, while it may be disheartening to witness the erosion of fuel conservation measures in the face of changes in consumer priorities, this court is nonetheless compelled to uphold the agency's standards. They are the result of a balancing process specifically committed to the agency by Congress, and, in this case, the weight given to consumer demand was not outside the range permitted by EPCA.

*CAS*, 793 F.2d 1322, 1340-41 (D.C. Cir. 1986). As in the situation presented in the *CAS* case, the agencies believed in 2012 based on the evidence then before them that fuel prices would be significantly higher than the fuel prices currently projected today. Using the fuel prices currently projected, which are lower because of the structural changes to the global oil market described at length above, Figure VIII-3 shows the difference in annual fuel consumption for a typical driver under the augural standards, proposed standards, and final standards. As the figure shows, the difference in annual consumption (for a user that drives 14K miles per year<sup>2987</sup>) is fewer than 40 gallons by MY 2030—the largest difference between the alternatives. Rising fuel

---

<sup>2987</sup> Parts of the central analysis assume a typical new vehicle is driven 14,000 miles per year, for each of the first three years it is owned. In practice, the average is slightly higher, though affected by a smaller number of users that drive much more than average. There is no single value that is representative of all households, and the National Household Travel Survey has shown lower annual usage estimates than 14,000 miles per year for a typical new vehicle.

prices over time increase the value of those forty gallons, but the diminishing returns to successive increases in fuel economy are nonetheless evident.<sup>2988</sup>

**Figure VIII-3 – Annual Fuel Consumption for a Typical Driver**

Thus, on the supply side, greater and more stable global oil supply, which reduces projected fuel prices, means that the benefits of more stringent CAFE standards are lower than they appeared to be in 2012 when the agencies believed oil supply would be scarcer and less stable, and projected fuel prices were consequently higher.

<sup>2988</sup> In general, because fuel savings are subject to diminishing returns as CAFE standards become more stringent, and per-vehicle costs increase as CAFE standards become more stringent, the relationship between per-vehicle costs and the value of fuel savings is more of a curve than a line, although the slope of the curve is reduced by the fact that we rely on EIA’s forecast of rising fuel prices over time.

On the demand side, as already explained, while NHTSA agrees that some consumers do seek out higher fuel economy, those consumers have vastly more higher fuel-economy-vehicle options than they did when the agencies wrote the 2012 final rule, as shown in Section IV above. For the other consumers who are driven more by the economics of their vehicle-purchasing decisions, NHTSA believes that they are likely making reasonably informed decisions about the new vehicle attributes they want in light of expectations about future fuel costs. This can be illustrated by examining estimated payback periods under the different regulatory alternatives, because payback period directly compares estimated future fuel savings with estimated vehicle purchase and ownership costs. A number of commenters suggested that per-vehicle cost was not a meaningful metric in isolation, because consumers would also be saving money on fuel under more stringent standards. The agencies discuss affordability issues further below, but the rulemaking presents Table VIII-12 here as a comparison of per-vehicle costs to lifetime fuel savings to illustrate the point raised by commenters:

**Table VIII-12 – Fuel Savings and Consumer Costs in MY 2029**

<b>Scenario Name</b>	<b>Lifetime Fuel Cost (\$)*</b>	<b>Regulatory Cost (vs. 2017)</b>	<b>Registration Costs (\$)</b>	<b>Payback Period (years)</b>
Augural Cafe Standards	21,771	2,770	5,158	5.0
0.00%/Y Pc And 0.00%/Y Lt During 2021-2026	23,967	1,383	4,919	4.6
0.50%/Y Pc And 0.50%/Y Lt During 2021-2026	23,925	1,409	4,922	4.6
1.50%/Y Pc And 1.50%/Y Lt During 2021-2026	23,570	1,641	4,962	4.6
1.00%/Y Pc And 2.00%/Y Lt During 2021-2026	23,501	1,676	4,968	4.6
1.00%/Y Pc And 2.00%/Y Lt During 2022-2026	23,079	1,922	5,013	4.5
2.00%/Y Pc And 3.00%/Y Lt During 2021-2026	22,938	1,993	5,026	5.0
2.00%/Y Pc And 3.00%/Y Lt During 2022-2026	22,604	2,222	5,067	5.0

\*Fuel savings are undiscounted for purposes of estimating payback period because payback periods and discount rates are interchangeable concepts, and today’s analysis represents consumer wiliness-to-pay for fuel economy by a 2.5 year desired payback period.

Table VIII-12 shows the differences in regulatory costs, other registration costs (taxes and financing, though the cost of insurance also increases to cover more expensive vehicles), lifetime fuel savings, and the payback relative to a MY 2017 vehicle. It is important to compare apples to apples, so in this case, because the agencies are considering fuel costs over a vehicle's full lifetime, this rulemaking needs to compare that against a broader lifetime cost of ownership, instead of comparing it simply to the estimated increase in initial purchase price. Under the original standards, the analysis projects that it would take a full five years for the undiscounted value of fuel savings to offset the estimated upfront increase in purchase cost (relative to a MY 2017 vehicle). For reference, the average new car buyer holds on to that car for about six or seven years.<sup>2989</sup> Naturally, this payback period, and the fuel savings on which it is based, depend upon fuel prices. Higher fuel prices shorten payback periods, while declining fuel prices lengthen them. For this analysis, the agencies have employed fuel prices estimated using the version of NEMS used to produce AEO 2019, as discussed in Section VI.

Thus, all of the regulatory alternatives considered in today's analysis result in significantly longer payback periods than the 2.5 years assumed by the agencies, the industry, and the NAS—i.e., while fuel economy would foreseeably improve in the rulemaking timeframe in the absence of regulation, it would do so at a rate slower even than the proposal would have required.<sup>2990</sup> NHTSA thus does not expect that consumer demand for fuel-efficient vehicles will

---

<sup>2989</sup> IHS Markit estimates the average length of new vehicle ownership at about 79 months, see <https://www.forbes.com/sites/jimgorzalany/2018/01/12/the-long-haul-15-vehicles-owners-keep-for-at-least-15-years/#4e971b576237>.

<sup>2990</sup> While presented at the industry level, technology application and compliance simulation occur at the level of each individual manufacturer's respective fleets. Some OEMs and fleets are able to increase CAFE more easily than others—starting from more favorable positions and adding less expensive technology, or taking advantage of credit provisions, to improve the fuel economy of their fleets. However, for several OEMs, even the proposed standards

grow significantly in the rulemaking timeframe without regulation to prop up manufacturer sales of significantly larger volumes of more fuel-efficient models. This increases the economic practicability of regulatory alternatives that represent less stringent standards, as compared to those that represent more stringent standards.

*(d) Manufacturer Compliance Shortfalls as Part of  
Economic Practicability*

Manufacturer compliance shortfalls given the pace of increase in standard stringency over time are also relevant to economic practicability, and were considered as part of the 2012 final rule. Some commenters argued that it was not reasonable for NHTSA to interpret automakers' fuel economy improvements over time as evidence that less stringent standards might be maximum feasible, suggesting that evidence of improvements means that improvements are possible, and that automakers' stated difficulties with meeting more stringent standards may be overstated. Fleet fuel economy improvements over time have been possible, NHTSA agrees. NHTSA does not agree, however, that improvements thus far constitute *de facto* evidence of automakers' ability to meet rapidly increasing standards indefinitely into the future. Section IV above illustrates this clearly—many more very fuel-efficient models are available now than in 2012, while fuel prices have been trending downward on an absolute basis over the same time period. Simultaneously and relatedly, the rate at which various manufacturer fleets have been falling short of their standards has been increasing steadily. As Section IV

---

are binding, and the costs associated with bringing their fleets into compliance are significant. At the level of the industry average, the cost of compliance with the proposal—and as a corollary, with the other alternatives—exceeds the 2.5 year payback for fuel economy technology, even while a small amount of overcompliance occurs at the industry level.

explains, at the time of the 2012 analysis, most manufacturers were in reasonable shape in terms of compliance. The total fleet outperformed CAFE standards by a full mile per gallon—reflecting the historical trend that the full fleet *always* exceeds the average fuel economy target.<sup>2991</sup> Of the then 45 import passenger car, domestic passenger car, and light truck compliance fleets in the 2012 model year, 26 of the fleets exceeded their fuel economy targets, while 19 failed to meet their standard.<sup>2992</sup> Of those 19 fleets that failed to meet their standard, the total shortfall was 41,033,802 credits—the equivalent of \$225,685,911 in penalties.<sup>2993</sup> That is no longer the case. 2016 marked the first model year in CAFE history that the entire light duty fleet failed to meet its target.<sup>2994</sup> This continued in the 2017 model year (the most recent full model year of compliance data).<sup>2995</sup> In the 2017 model year, of the now 42 compliance fleets, only 14 fleets exceeded their targets.<sup>2996</sup> 25 failed to meet their target, with a total shortfall of 166,715,863 credits—the equivalent of \$1,133,430,584 in penalties.<sup>2997</sup> Required manufacturer reporting data shows the situation continuing to get worse in the 2018 and 2019 model years,<sup>2998</sup> despite manufacturers’ increasing ability to utilize generous credit provisions related to alternative fueled vehicles and A/C efficiency and off-cycle adjustments.

<sup>2997</sup> *Id.*

<sup>2998</sup> *Id.*

Although each year has continued to see improvements in fuel economy performance, each successive increase in stringency requires many fleets not only to achieve the new level from the resulting increase, but to resolve deficits from the prior year as well. The problem is particularly marked in the light truck fleet, where sales of lower fuel-economy vehicles have proliferated over this time period, despite availability of higher fuel-economy models. But the passenger car fleet is facing compliance challenges as well, as more consumers have shifted away from sedans and into crossover utility vehicles that are considered passenger cars for compliance purposes. While the agencies' move toward footprint based standards account for vehicle length and track width—which certainly affect fuel economy as described above—they do not account for mass-intensive increases in vehicle ride height that crossover purchasers value, the additional frontal area and higher drag at highway speeds, or the additional power required to achieve similar performance as the equivalent sedan. These issues are further exacerbated by the fact that consumers are demanding more powerful engines than the baseline efficient four cylinder versions the agencies assumed consumers would find acceptable, instead opting to upgrade to more powerful powertrains.<sup>2999</sup> If the augural standards were finalized and energy prices remain as currently projected, the shortfall situation could well erase large portions of assumed fuel savings/emissions reduction benefits from higher standards.

In the current analysis, gasoline prices are projected to rise steadily from about \$2.50/gallon in 2017 to \$3.5/gallon by 2035. While CAFE can provide some insurance against unexpected and sudden price increases, in the case of sustained, consistent increases in gasoline

---

<sup>2999</sup> Mr. Rykowski's comments for EDF, for example, stated that EPA's recent Fuel Economy and CO<sub>2</sub> Trends Reports show clearly that manufacturers have been improving vehicle performance at the expense of fuel economy. *See* NHTSA-2018-0067-12018, at 31.

prices, market demand for fuel economy would outpace the standards over time. In an earlier analysis, the agencies considered the impact of a sudden gasoline price shock in a single year, where the price of gasoline jumped from \$3.50/gallon to \$6/gallon for most of a year. If instead of that one-year spike, the price of gasoline rose steadily from current levels to \$6/gallon by 2040, the response of both consumers and manufacturers in the marketplace would cause the industry to consistently over-comply with even the augural standards.<sup>3000</sup> The payback assumption in this analysis, where consumers are willing to pay for any fuel economy improvement that pays for itself in the first 2.5 years of vehicle usage, would likely be too short in a world with \$6/gallon gasoline, where the cost of operating a vehicle consumed a larger share of a household's budget and even longer payback periods could be seen as sound investments. Thus, if it turns out that fuel prices rise steadily over the next decade, at a significantly faster rate than currently projected, the market will end up demanding more efficient vehicles and the gap between the baseline and the preferred alternative will shrink further. However, the agencies do not currently have information that projects \$6/gallon fuel in 2040 is likely, for the reasons discussed at length above.

As also discussed above, while the analysis for this final rule does not show significant shortfalls under any regulatory alternative, that appearance of compliance is predicated on the assumption that automakers will be able to sell the hybrids that we simulate them producing in response to the standards. Again, given foreseeably low fuel prices going forward, it is also foreseeable that selling greater volumes of hybrid vehicles will be even more difficult than at

---

<sup>3000</sup> We simulated this response in the CAFE Model, where all other inputs were identical to the central analysis.

present. It is very possible that manufacturer compliance shortfalls could end up being worse than the agency's analysis currently forecasts for the more stringent alternatives.

Given the ongoing shortfall problem illustrated above, and given the payback period estimates, the proposal might appear to be the correct answer in the absence of other considerations. NHTSA believes that the bubble concerns may be significant, and the diminishing returns of higher standards identified in Section IV above calls into question the value of pushing that bubble. Compliance shortfalls represent a growing problem with the current standards and will continue to be a problem if stringency does not converge at least somewhat more closely with what the market appears willing to bear. If industry is unable to comply with standards, that non-compliance means that the standards are not achieving what they set out to achieve in terms of fuel savings or emissions reductions, or at least they are not achieving what NHTSA estimated they would achieve. The NPRM disagreed with the idea that “if you build it, they will come”—that manufacturers would find a way to market higher fuel-economy vehicles, and consumers would eventually buy them. Comments on that topic were mixed: some commenters agreed with the NPRM's sentiment, while other commenters argued that manufacturers' past ability to exceed standards combined with consumers' growing interest in fuel economy/lower emissions meant that concerns about the market's ability to bear further increases were misplaced. The shortfall discussion above and in Section IV suggests that the NPRM's sentiment may be accurate, but this difference in perspective highlights the core philosophical question of the CAFE program—whether consumers should choose for themselves how much fuel economy they want, or whether the government should choose for them.

*(4) Considering Safety Along with the Other Factors in  
Determining Maximum Feasible Standards*

In addition to the above, as explained in the NPRM and as discussed extensively by commenters, NHTSA considers safety effects in determining maximum feasible CAFE standards. A number of commenters objected to aspects of the safety analysis, as discussed in Section VI above, and some made suggestions for improvement. In response to those comments, NHTSA took a very conservative approach in making a number of changes to the safety analysis for this final rule:

- Commenters disagreed with certain aspects of the sales and scrappage effects on the safety analysis; in response to those comments, changes have been made and the scrappage effect on fatalities is lower now than it was in the NPRM;
- Commenters disagreed with certain aspects of mass reduction; in response to those comments, changes have been made there;
- Commenters argued that additional technologies should be accounted for; in response to those comments, many of those technologies have been added;
- Commenters argued that the NPRM did not account for crash avoidance technologies; in response to those comments, the final rule accounts for the effects of crash avoidance technologies;
- Commenters argued that the NPRM did not account for the mortality/morbidity effects of criteria pollution differences between the alternatives; in response, the final rule accounts for these effects explicitly in these values.

Overall, the final rule analysis suggests that fatalities may be lower than the NPRM analysis showed; injuries may be greater; and the safety effects overall are less than the NPRM suggested, but they are still significant. Less-stringent standards remain better for safety and are projected to save thousands of lives and prevent tens of thousands of hospitalizations, even if the amount by which they are better is lower than previously estimated.

EPCA/EISA directs NHTSA to conserve energy and consider the need of the U.S. to conserve energy, while simultaneously directing NHTSA to set attribute-based standards whose outcome varies depending on what consumers choose to buy, and directing NHTSA to consider economic practicability. The greater the need of the U.S. to conserve energy, the more the government should decide for consumers how much fuel economy will be in their new vehicles. Based on the information before NHTSA in this final rule, NHTSA agrees with the commenters who suggested that increasing CAFE stringency can function as “insurance” against future oil price volatility, although as illustrated above, the short-term effects of that insurance may be relatively minor and the longer-term effects may be too uncertain to consider meaningfully. NHTSA also agrees that environmental considerations necessitate energy conservation, though the long-term benefits of emissions reductions (even accounting for the increased costs of delayed action) require consideration of the immediate costs to consumers, the industry, and the environment.

Balancing all of the factors and issues identified above, NHTSA concludes that standards that increase at 1.5% per year are the maximum feasible for passenger cars and light trucks for MYs 2021-2026, based on the information currently before the agency. We recognize that more stringent standards, including the baseline/augural standards, could conserve more energy and might be technologically feasible (in the narrowest sense), but the additional incremental fuel

savings, emissions reductions, and environmental benefits of higher standards is not significant enough to outweigh the immediate economic costs. There is still risk to the U.S. from circumstances outside our control that the CAFE program may be able to mitigate, but there must also be recognition of the limited extent to which this program can address that risk, certainly without exacerbating considerable challenges currently being faced by automakers, dealers, and consumers. Economic practicability would be best served by slower increases, as discussed above. And while these two factors weigh in different directions, NHTSA has discretion to accommodate conflicting statutory priorities in a reasonable manner. Beginning with MY 2021, the first MY addressed by this rule, Congress eliminated the obligation to increase FE standards ratably.<sup>3001</sup> Thus, the appropriateness of an increase, if any, is within NHTSA's discretion based on its balancing of statutory factors.<sup>3002</sup>

In past rulemakings, as discussed above, NHTSA has expressly considered the point at which net benefits appear to be maximized as potentially relevant to determining maximum feasible CAFE standards.<sup>3003</sup> Whether the standards maximize net benefits has thus been a

---

<sup>3001</sup> Previously applied for MYs 2011-2020.

<sup>3002</sup> NHTSA also notes that it was expressly anticipated in the 2012 final rule that the current rulemaking could determine that the augural standards were not maximum feasible. NHTSA stated that “Whether different alternatives may be maximum feasible can also be influenced by differences and uncertainties in the way in which key economic factors (*e.g.*, the price of fuel and the social cost of carbon) and technological inputs could be assessed and valued. While NHTSA believes that our analysis for this final rule uses the best and most transparent technology-related inputs and economic assumption inputs that the agencies could derive for MYs 2017-2025, *we recognize that there is uncertainty in these inputs, and the balancing could be different if the inputs were different. When the agency undertakes the future rulemaking to develop final standards for MYs 2022-2025, for example, we expect that much new information will inform that future analysis, which may potentially lead us to choose different standards than the augural ones presented today.*” (emphasis added) 77 FR at 63037 (Oct. 15, 2012).

<sup>3003</sup> *See, e.g.*, the 2006 final rule, which concluded that the point at which net benefits were maximized *was* the maximum feasible CAFE level (71 FR 17566 (Apr. 6, 2006)); the 2010 final rule, which considered among the regulatory alternatives one that maximized net benefits, but explained that nothing in EPCA or EISA mandated that NHTSA choose CAFE standards that maximize net benefits (75 FR 25324, at 25606, 25167 (May 7, 2010)); and the 2012 final rule, which also considered among the regulatory alternatives one that maximized net benefits, and also explained that nothing in EPCA or EISA mandated that NHTSA choose CAFE standards that maximize net benefits,

significant, but not dispositive, factor in the past for NHTSA’s consideration of economic practicability. Executive Order 12866, as amended by Executive Order 13563, states that agencies should “select, in choosing among alternative regulatory approaches, those approaches that maximize net benefits. . .” In practice, however, NHTSA must consider that the modeling of net benefits does not capture all considerations relevant to the EPCA statutory factors.

Additionally, nothing in EPCA or EISA mandates that NHTSA set standards at the point at which net benefits are maximized, and case law confirms that whether to maximize net benefits in determining maximum feasible standards is within NHTSA’s discretion.<sup>3004</sup> As explained extensively in prior rulemakings, even if the agency believed it could quantify enough relevant factors to determine the CAFE levels at which net benefits were maximized with reasonable accuracy, there may be other considerations which lead the agency to conclude that maximum feasible CAFE standards are not the ones that maximize net benefits. For example, in 2012, NHTSA rejected the regulatory alternative that appeared to maximize net benefits (and all alternatives more stringent than that one) based on the conclusion that even though net benefits were maximized, the “resultant technology application and cost” were simply too high, and thus made those standards economically impracticable, and thus beyond maximum feasible.<sup>3005</sup>

---

in fact, directly rejecting the regulatory alternative that maximized net benefits as beyond maximum feasible for the MYs 2017-2025 timeframe (77 FR 62624 (Oct. 15, 2012)).

<sup>3004</sup> The Ninth Circuit has agreed with NHTSA that “EPCA neither requires nor prohibits the setting of standards at the level at which net benefits are maximized,” stating further that “The statute is silent on the precise question of whether a marginal cost-benefit analysis may be used. See *Chevron*, 467 U.S. at 843, 104 S.Ct. 2778. Public Citizen and Center for Auto Safety persuade us that NHTSA has discretion to balance the oft-conflicting factors in 49 U.S.C. 32902(f) when determining “maximum feasible” CAFE standards under 49 U.S.C. 32902(a).” *CBD v. NHTSA*, 538 F.3d 1172, 1188 (9th Cir. 2008).

<sup>3005</sup> 77 FR at 63050 (Oct. 15, 2012).

Table VII-95 and Table VII-96, above, appear to suggest that net benefits would be maximized under a 3 percent discount rate by choosing the 2%/3% alternative, and under a 7 percent discount rate by choosing the 0% (proposed) alternative. Across all alternatives under either discount rate, the variation in net benefits is within \$20 billion over the lifetimes of vehicles produced during the rulemaking timeframe. While \$20 billion may seem like a large amount of money, it must be understood within context—the auto industry accounted for approximately \$89 billion of U.S. GDP in 2018 alone,<sup>3006</sup> and Americans spent approximately \$370 billion on gasoline in 2019 alone.<sup>3007</sup> For a program this large, if the difference between the net benefits created by different regulatory alternatives is within \$20 billion (over the full lifetimes of six model years), the net benefits are relatively small. Furthermore, given how close together the net benefits are across the range of regulatory alternatives considered, NHTSA does not believe that the point at which net benefits are maximized is meaningful for determining maximum feasible CAFE standards in this final rule.

Important to that conclusion is the fact that the net benefits estimates produced by the analysis depend heavily on EIA’s future forecasts of fuel prices, which were made prior to the recent collapse of oil prices. If the former OPEC+ members continue to pursue market share, fuel prices will likely continue to drop. If, instead of pursuing market share, they try to control prices by restricting supply, U.S. shale production can ramp back up and exert downward pressure on price. If fuel prices end up even lower than our analysis assumes, benefits from

---

<sup>3006</sup> See Bureau of Economic Analysis, GDP by Industry, “Value Added by Industry,” Oct. 29, 2019, <https://apps.bea.gov/iTable/iTable.cfm?ReqID=51&step=1> (accessed Mar. 18, 2020)

<sup>3007</sup> Using EIA estimates of an average of \$2.60/gallon gasoline cost in 2019 (<https://www.eia.gov/todayinenergy/detail.php?id=42435>) and EIA estimates of about 142 billion gallons total gasoline consumed (<https://www.eia.gov/tools/faqs/faq.php?id=23&t=10>).

saving additional fuel will be worth even less to consumers. Our analysis captures none of these effects. Depending upon future fuel prices, net benefits estimates described above could foreseeably be overstated, possibly by a significant amount. It is possible, depending on future fuel prices, that the final rule 1.5 percent annual increase standards could end up being more stringent than standards that would maximize net benefits. Moreover, sustained low oil prices can be expected to have real effects on consumer demand for additional fuel economy, which will have real effects on sales, jobs, and many other things relevant to NHTSA's consideration of what standards would be maximum feasible. Choosing a regulatory alternative more stringent than the final rule's 1.5 percent annual increases could foreseeably either lead to more hybridization than the market is likely to bear given foreseeably low fuel prices, or lead to significantly more cost than the analysis currently suggests. Neither of those outcomes would be beneficial for consumers or for industry, even considering the additional fuel savings for consumers.<sup>3008</sup>

---

<sup>3008</sup> It is within NHTSA's discretion to adopt an alternative based on unquantified/unquantifiable benefits. *See, e.g., Inv. Co. Inst. v. Commodity Futures Trading Comm'n*, 720 F.3d 370, 379 (D.C. Cir. 2013) ("The appellants further complain that CFTC failed to put a precise number on the benefit of data collection in preventing future financial crises. But the law does not require agencies to measure the immeasurable. CFTC's discussion of unquantifiable benefits fulfills its statutory obligation to consider and evaluate potential costs and benefits. *See Fox*, 556 U.S. at 519, 129 S.Ct. 1800 (holding that agencies are not required to 'adduce empirical data that' cannot be obtained). Where Congress has required 'rigorous, quantitative economic analysis,' it has made that requirement clear in the agency's statute, but it imposed no such requirement here. *American Financial Services Ass'n v. FTC*, 767 F.2d 957, 986 (D.C.Cir.1985); *cf., e.g., 2 U.S.C. § 1532(a)* (requiring the agency to 'prepare a written statement containing ... a qualitative and quantitative assessment of the anticipated costs and benefits' that includes, among other things, 'estimates by the agency of the [rule's] effect on the national economy'); *BellSouth Corp. v. FCC*, 162 F.3d 1215, 1221 (D.C.Cir.1999) ('When ... an agency is obliged to make policy judgments where no factual certainties exist or where facts alone do not provide the answer, our role is more limited; we require only that the agency so state and go on to identify the considerations it found persuasive').")

NHTSA concludes that steady increases at 1.5 percent annually, with the same rate for cars and trucks as suggested by several commenters, are the optimal way to move the needle forward on fuel economy, fuel savings, and emissions reductions without imposing excessive cost on automakers and consumers and overly reducing vehicle sales. Requiring demand changes (through CAFE standards) much faster than what the market will bear creates a substantial likelihood of a mis-match between what companies produce and what consumers buy. While companies can manage that mis-match for short periods through incentivization and cross-subsidization, we have seen that over time automakers begin to fall short on fuel economy performance relative to the standards. Over time, if swaths of the industry continually fall short of fuel economy targets, and consumer demand for fuel economy does not significantly increase, then continuing to force technology into the fleet does not achieve the program's objectives (i.e., energy conservation). This is the case regardless of how much manufacturers spend manufacturing vehicles that consumers do not purchase (implicating concerns with economic practicability) to reduce their compliance liability. This is one part of why NHTSA believes that the 1.5 percent alternative is maximum feasible during the rulemaking timeframe.

While the 1.5 percent alternative being finalized is new for the final rule, it is responsive to comments requesting steady increases at the same rate for both cars and trucks, and it is within the range of rates of increase considered in the NPRM. As both the NPRM analysis and the final rule analysis show, after MY 2020 the proposed (0%) standards are not binding at the industry level (though some manufacturers, and fleets, remain below their standard after that model year) as a consequence of market demand for fuel economy at projected gasoline prices. However, the preferred (1.5% percent) alternative, while producing slightly higher achieved CAFE levels, tracks closely to the level produced by the combination of existing CAFE standards (through MY

2020) and subsequent market demand for fuel economy represented by the proposal. It is also likely close to the point at which net benefits will be maximized, even if it remains unclear exactly where that point will end up.

As a kind of insurance policy against future fuel price volatility, standards that increase at 1.5 percent per year for cars and trucks will help to keep fleet fuel economy higher than they would be otherwise when fuel prices are low, which is not improbable over the next several years.<sup>3009</sup> These standards will also enable industry to choose how to spend the capital that would otherwise be spent meeting more stringent standards on more of what consumers are demanding, which could also include more fuel economy if the market heads unexpectedly in that direction. As explained above, even if more stringent standards might be technologically feasible in a narrow sense, and even if the effect of other motor vehicle standards of the Government does not vary significantly between regulatory alternatives, economic practicability concerns still counsel against more stringent standards, and the need of the U.S to conserve energy does not, at present, appear to counsel toward higher stringency. Standards that increase at 1.5 percent per year represent a reasonable balance of additional technology and required per-vehicle costs, consumer demand for fuel economy, fuel savings and emissions avoided given the foreseeable state of the global oil market and the minimal effect on climate between finalizing 1.5 percent standards versus more stringent standards. The final standards will also result in year-over-year improvements in fleetwide fuel economy, resulting in energy conservation that helps

---

<sup>3009</sup> For example, EIA currently expects U.S. retail gasoline prices to average \$2.14/gallon in 2020, compared to \$2.69/gallon in 2019 (*see* <https://www.eia.gov/outlooks/steo/archives/mar20.pdf>), and \$3.68/gallon in 2012 (*see* [https://www.eia.gov/dnav/pet/hist/LeafHandler.ashx?n=PET&s=EMM\\_EPM0\\_PTE\\_NUS\\_DPG&f=A](https://www.eia.gov/dnav/pet/hist/LeafHandler.ashx?n=PET&s=EMM_EPM0_PTE_NUS_DPG&f=A)). While gasoline prices may foreseeably rise over the rulemaking time frame, it is also very foreseeable that they will not rise to the \$4-5/gallon that many American saw over the 2008-2009 time frame, that caused the largest shift seen toward smaller and higher-fuel-economy vehicles. *See, e.g.*, Figure VIII-2 above.

address environmental concerns, including criteria pollutant, air toxic pollutant, and carbon emissions. All things considered, NHTSA determines that an increase of 1.5 percent per year is maximum feasible for both passenger cars and light trucks for MYs 2021-2026.

## **IX. Compliance and enforcement**

### **A. Introduction**

#### **1. Overview**

The CAFE and CO<sub>2</sub> emissions standards are both fleet-average standards, and for both programs, determining compliance begins by testing vehicles on dynamometers in a laboratory over pre-defined test cycles under controlled conditions.<sup>3010</sup> A machine is connected to the vehicle's tailpipe while it performs the test cycle, which collects and analyzes the resulting exhaust gases; a vehicle that has no tailpipe emissions has its performance measured differently, as discussed below. CO<sub>2</sub> quantities, as one of the exhaust gases, can be evaluated for vehicles that produce CO<sub>2</sub> emissions directly. Fuel economy is determined from the amount of CO<sub>2</sub> emissions, because the two are directly mathematically related.<sup>3011</sup> Manufacturers generally

---

<sup>3010</sup> For readers unfamiliar with this process, it is similar to running a car on a treadmill following a program—or more specifically, two programs. 49 U.S.C. 32904(c) states that, in testing for fuel economy, EPA must “use the same procedures for passenger automobiles [that EPA] used for model year 1975 (weighted 55 percent urban cycle and 45 percent highway cycle), or procedures that give comparable results.” Thus, the “programs” are the “urban cycle,” or Federal Test Procedure (abbreviated as “FTP”) and the “highway cycle,” or Highway Fuel Economy Test (abbreviated as “HFET”), and they have not changed substantively since 1975. Each cycle is a designated speed trace (of vehicle speed versus time) that vehicles must follow during testing—the FTP is meant roughly to simulate stop and go city driving, and the HFET is meant roughly to simulate steady flowing highway driving at about 50 mph. The 2-cycle dynamometer test results differ somewhat from what consumers will experience in the real world driving environment because of the lack of high speeds, rapid accelerations, and hot and cold temperatures evaluations with the A/C operation. These added conditions are more so reflected in the EPA 5-cycle test results listed on each vehicle's fuel economy label and on the fueleconomy.gov website.

<sup>3011</sup> Technically, for the CAFE program, carbon-based tailpipe emissions (including CO<sub>2</sub>, CH<sub>4</sub>, and CO) are measured, and fuel economy is calculated using a carbon balance equation. EPA uses carbon-based emissions (CO<sub>2</sub>, CH<sub>4</sub>, and CO, the same as for CAFE) to calculate the tailpipe CO<sub>2</sub> equivalent for the tailpipe portion of its standards.

perform their own testing, and EPA confirms and validates those results by testing a sample of vehicles at the National Vehicle and Fuel Emissions Laboratory (NVFEL) in Ann Arbor, Michigan. The results of this testing form the basis for determining a manufacturer's compliance in a given model year, through the following steps:

- Each vehicle model's performance on the test cycles is calculated;
- The number of vehicles of that model that were produced is divided by the performance;
- That number, in turn is summed for all the manufacturer's model types;
- The manufacturer's total product volume is then divided by the summed value of all the model types; and
- That number represents the manufacturer's fleet harmonic average performance.

That performance is then compared to the manufacturer's unique compliance obligation (standard). This compliance obligation is calculated using the same approach that is used to determine performance, except that the fuel economy or CO<sub>2</sub> target value (based on the footprint of each vehicle model) is used instead of the model's measured performance value. The fuel economy or CO<sub>2</sub> target values for each of the vehicle models in the manufacturer's fleet and production volumes are used to derive the manufacturer's fleet harmonic average standard. Using fuel economy targets to illustrate the concept, the following figure shows two vehicle models produced in a model year for which passenger cars are subject to a fuel economy target function that extends from about 30 mpg for the largest cars to about 41 mpg for the smallest cars:

**Figure IX-1 – Illustration of Vehicle Models vs. Fuel Economy Targets**

If these are the only two vehicle models the manufacturer produces, the manufacturer’s required CAFE obligation is determined by calculating the production-weighted harmonic average of the fuel economy target values applicable at the hatchback and sedan footprints (from the curve, about 41 mpg for the hatchback and about 33 mpg for the sedan). The manufacturer’s achieved CAFE level is determined by calculating the production-weighted harmonic average of the hatchback and sedan fuel economy levels (in this example the values shown in the boxes in Figure IX-1, 48 mpg for the hatchback and 25 mpg for the sedan). Depending on the relative mix of hatchbacks and sedans the manufacturer produces, the manufacturer’s fleet may meet the standard, or perform better than the standard (if required CAFE is less than achieved CAFE) and thereby earn credits or perform worse than the standard (if required CAFE is greater than

achieved CAFE) and thereby have a shortfall that may be made up, in whole or in part, using CAFE credits, discussed below, or be subject to civil penalties. Although the arithmetic is different for CO<sub>2</sub> standards (which do not involve harmonic averaging), the underlying concept is the same.

There are thus two parts to the foundation of compliance with CAFE and CO<sub>2</sub> emissions standards: first, how well any given vehicle model performs relative to its target, and second, how many of each vehicle model a manufacturer produces. While no given model need precisely meet its target (and virtually no model exactly meets its target in the real-world), if a manufacturer finds itself producing large numbers of vehicles that fall well short of their targets, it will have to find a way of offsetting that shortfall, either by increasing production of vehicles that exceed their targets, or by taking advantage of compliance flexibilities and incentives, or the manufacturer will be subject to civil penalties. Given that manufacturers typically need to produce for sale vehicles that consumers want to buy, and not all consumers value fuel economy, their options for pursuing the former approach can often be limited.

The CAFE and CO<sub>2</sub> programs both offer a number of compliance flexibilities and incentives, discussed in more detail below. For example, starting in model year 2017, manufactures have flexibility to account for efficiency improvements in air conditioning (A/C) systems and/or for the application fuel economy improving technologies that increase fuel economy in the real-world, but that are, in whole or in part, not accounted for (e.g., stop-start technology, or high efficiency alternators) using the 1975-based 2-cycle compliance

dynamometer test procedures.<sup>3012</sup> These fuel economy improvements are added to the 2-cycle performance results and are included in the calculation of a manufacturer’s fuel economy in determining compliance relative to standards. In addition, for MYs 2017 – 2021, there are also two levels of compliance incentives for full-size pickup trucks with mild-HEV or strong-HEV technology or that overperform standards by 15 percent or more, or by 20 percent or more.<sup>3013</sup> This final rule removes this incentive starting in MY 2022, as discussed in more detail below. These fuel economy improvements are also included, for those model years and as earned, in the calculation of a manufacturer’s fuel economy.<sup>3014</sup>

Some flexibilities and incentives are expressly provided for by statute, and some have been implemented by the agencies through regulations, consistent with the statutory scheme. Compliance flexibilities and incentives for the CAFE and CO<sub>2</sub> programs have a great deal of theoretical attractiveness: if designed properly, they can help to reduce overall regulatory costs, while maintaining or improving programmatic benefits. If designed poorly, they may create significant potential for market distortion (for instance, when manufacturers—in response to an incentive to deploy a particular type of technology—produce vehicles for which there is no natural market, such vehicles must be discounted in order to sell).<sup>3015</sup> Manufacturers’ use of

---

<sup>3012</sup> EPA regulations provided an equivalent program beginning in MY 2012.

<sup>3013</sup> Manufacturers also must apply the technology to a minimum percentage of their full-size pickup truck production.

<sup>3014</sup> NHTSA characterizes any programmatic benefit manufacturers can use to comply with CAFE standards that fully accounts for fuel use as a “flexibility” (e.g., credit trading) and any benefit that counts less than the full fuel use as an “incentive” (e.g., adjustment of alternative fuel vehicle fuel economy). NHTSA flexibilities and incentives are discussed further in Section IX.D.

<sup>3015</sup> While many manufacturers publicly discuss their commitment to certain technologies that reduce CO<sub>2</sub> emissions, consumer interest in them thus far remains low, despite often-large financial incentives from both manufacturers and the Federal and State governments in the form of tax credits (i.e., natural gas or fuel-cell vehicles). It is questionable whether continuing to provide significant compliance incentives for technologies that

compliance flexibilities and incentives requires proper governmental and industry collaboration for manufacturers to achieve the most effective pathways to compliance.<sup>3016</sup> Overly-complicated flexibility and incentive programs can result in greater expenditure of both private sector and government resources to track, account for, and manage. Moreover, flexibilities or incentives that tend to favor specific technologies could distort the market. By these means, compliance flexibilities or incentives could create an environment in which entities are encouraged to invest in such favored technologies and, unless those technologies are independently supported by market forces, encourage rent seeking in order to protect, preserve, and enhance profits of companies that seek to take advantage of the distortions created by government mandate. Further, to the extent that there is a market demand for vehicles with lower CO<sub>2</sub> emissions and higher fuel economy, compliance flexibilities and incentives may cause some manufacturers to fall behind the industry's pace if they become overly reliant on them rather than simply improving the efficiency of their vehicles to meet that market demand.

If standards are maximum feasible levels, as required by statute, then the need for extensive compliance flexibilities and incentives should be low. The agencies sought comments in the NPRM on whether and how each agency's existing flexibilities and incentives might be amended, revised, or deleted to avoid the inefficiencies and market distortions discussed above. Specifically, comments were sought on the appropriate level of compliance flexibility, including credit trading, in a program that is correctly designed to be maximum feasible, in accordance

---

consumers appear not to want is an efficient means to achieve either compliance or national goals (*see, e.g.*, Congress' phase-out of the AMFA dual-fueled vehicle incentive in EISA, 49 U.S.C. 32906).

<sup>3016</sup> For these reasons, in this final rule, NHTSA is asking manufacturers to provide more detailed information on the new incentives allowed for A/C and off-cycle technologies and on credit trades for better collaboration in understanding the economic impact of these flexibilities and incentives and for the government to provide better oversight of the CAFE program.

with the statute. Comments were also sought on whether to allow *all* incentive-based adjustments, except those that are mandated by statute, to expire, in addition to other possible simplifications to reduce market distortion, improve program transparency and accountability, and improve overall performance of the compliance programs. The agencies considered comments on those issues in preparing the final rule. A summary of all the flexibilities for the CAFE and CO<sub>2</sub> programs finalized as a part of this final rule is provided in Table IX-1 through Table IX-4.

**Table IX-1 – Statutory flexibilities for over-compliance with standards**

Regulatory item	NHTSA			EPA		
	Authority	Current Program	Final Rule	Authority	Current Program	Final Rule
Credit Earning	49 U.S.C. 32903(a)	Yes, denominated in tenths of a mpg	No change	CAA 202(a)	Yes, denominated in g/mi	No change
Credit “Carry-forward”	49 U.S.C. 32903(a)(2)	5 MYs into the future	No change	CAA 202(a)	5 MYs into the future (except MYs 2010-2015 = credits may be carried forward through MY 2021)	No change
Credit “Carryback” (AKA “deficit carry-forward”)	49 U.S.C. 32903(a)(1)	3 MYs into the past	No change	CAA 202(a)	3 MYs into the past	No change
Credit Transfer	49 U.S.C. 32903(g)	Up to 2 mpg per fleet; transferred credits may not be used to meet min DPC standard	No change; Alliance/Global request to reconsider prior interpretation is denied	CAA 202(a)	Unlimited	No change

Regulatory item	NHTSA			EPA		
	Authority	Current Program	Final Rule	Authority	Current Program	Final Rule
Credit Trade	49 U.S.C. 32903(f)	Unlimited quantity; traded credits may not be used to meet min DPC standard	No change	CAA 202(a)	Unlimited	No change

**Table IX-2 – Flexibilities that address gaps in compliance test procedures**

Regulatory item	NHTSA			EPA		
	Authority	Current Program	Final Rule	Authority	Current Program	Final Rule
A/C efficiency	49 U.S.C. 32904	Allows mfrs to earn “fuel consumption improvement values” (FCIVs) equivalent to EPA credits starting in MY 2017	No change, except to add advanced A/C compressor technology to the pre-approved menu; (Alliance/ Global request to allow retroactive starting in MY 2012 is denied)	CAA 202(a)	“Credits” for A/C efficiency improvements up to caps of 5.0 g/mi for cars and 7.2 g/mi for trucks	No change, except to add advanced A/C compressor technology to the pre-approved menu.

Regulatory item	NHTSA			EPA		
	Authority	Current Program	Final Rule	Authority	Current Program	Final Rule
Off-cycle	49 U.S.C. 32904	Allows mfrs to earn “fuel consumption improvement values” (FCIVs) equivalent to EPA credits starting in MY 2017	Add high efficiency alternators to the pre-approved menu; (Alliance/ Global request to allow retroactive starting in MY 2012 is denied); allow suppliers to begin petition process	CAA 202(a)	“Menu” of pre-approved credits (~10), up to cap of 10 g/mi for MY 2014 and beyond; other pathways require EPA approval through either 5-cycle testing or through public notice and comment	Add high efficiency alternators to the pre-approved menu; allow suppliers to begin petition process

**Table IX-3 – Incentives that encourage application of technologies**

Regulatory item	NHTSA			EPA		
	Authority	Current Program	Final Rule	Authority	Current Program	Final Rule
Full-size pickup trucks with HEV or overperforming target	49 U.S.C. 32904	Allows mfrs to earn FCIVs equivalent to EPA credits starting in MY 2017 and ending in MY 2025	Delete beginning with MY 2022	CAA 202(a)	10 g/mi for full-size pickups with mild hybrids OR overperforming target by 15% (MYs 2017-2021); 20 g/mi for full-size pickups with strong hybrids OR overperforming target by 20% (MYs 2017-2025)	Delete beginning with MY 2022

**Table IX-4 – Incentives that encourage alternative fuel vehicles**

Regulatory item	NHTSA			EPA		
	Authority	Current Program	Final Rule	Authority	Current Program	Final Rule
Dedicated alternative fuel vehicle	49 U.S.C. 32905(a) and (c)	Fuel economy calculated assuming gallon of liquid or gallon equivalent gaseous alt fuel = 0.15 gallons of gasoline; for EVs petroleum equivalency factor	No change	CAA 202(a)	Multiplier incentives for EVs and FCVs (each vehicle counts as 2.0/1.75/1.5 vehicles in 2017-2021), NGVs (1.6/1.45/1.3 vehicles); each EV = 0 g/mi upstream emissions through MY 2021 (then phases out based on per-mfr production cap of 200k vehicles)	Multiplier of 2.0 added for MY 2022-2026 NGVs. No change to EV and FCV multipliers that phase out after MY 2021. Electricity usage = 0 g/mi extended through MY 2026.
Dual-fueled vehicles	49 U.S.C. 32905(b), (d), and (e); 32906(a)	FE calc using 50% operation on alt fuel and 50% on gasoline through MY 2019. Starting with MY 2020, NHTSA will begin using the SAE defined "Utility Factor" methodology to account for actual potential use, and "F-factor" for FFV. NHTSA will continue to incorporate the 0.15 incentive factor.	No change	CAA 202(a)	Multiplier incentives for PHEVs and NGVs (each vehicle counts as 1.6/1.45/1.3 vehicles in 2017-2021); electric operation = 0 g/mi through MY 2021 (then phases out based on per-mfr production cap of 200k vehicles); "Utility Factor" method for use, and "F-factor" for FFV.	Multiplier of 2.0 added for MY 2022-2026 NGVs. No change to EV and FCV multipliers that phase out after MY 2021. Electricity usage = 0 g/mi extended through MY 2026.
Connected/Automated Vehicles	n/a	n/a	n/a	CAA 202(a)	Mfrs can petition for off-cycle credits	No change
High-octane fuel blends	n/a	n/a	n/a	CAA 202(a)	No incentives or requirements	No change

## 2. Light-Duty CAFE Compliance Data for MYs 2011-2019

To understand manufacturers' potential approaches to using compliance flexibilities and incentives, CAFE compliance data for MYs 2011 through 2019 is discussed in this section. NHTSA believes that providing these data is important because it gives the public a better understanding of current compliance trends and the potential impacts that increasing CAFE standards have had on those model years and future model years addressed by this rulemaking.

NHTSA uses data from CAFE reports submitted by manufacturers to EPA or directly to NHTSA to evaluate compliance with the CAFE program. The data for MYs 2011 through 2017 include manufacturers' final compliance data that have been verified by EPA.<sup>3017</sup> The data for MYs 2018 and 2019 include the most recent projections from manufacturers' mid-model year and final-model year reports submitted to EPA and NHTSA, as required by 49 CFR Part 537 and 40 CFR 600.512-12.<sup>3018</sup> Because the projections do not reflect final vehicle production levels, the EPA verified final CAFE values may be slightly different than the manufacturers' projections. MY 2011 was selected as the start of the data because it represents the first compliance model year for which manufacturers were permitted to trade and transfer credits.<sup>3019</sup> MY 2019 is also important because it shows the projected performance of the fleet two years after manufacturers were allowed to use new flexibilities and incentives starting in MY 2017 to address increasing CAFE standards.

---

<sup>3017</sup> The data contain the latest information available from manufacturers except certain low volume manufacturers complying with standards under 49 CFR part 525.

<sup>3018</sup> MY 2018 data come from information received in manufacturers' final reports submitted to EPA according to 40 CFR 600.512-12 and MY 2019 data come from information received in manufacturers' mid-model year CAFE reports submitted to NHTSA according to 49 CFR part 537.

<sup>3019</sup> 49 CFR 535.6(c).

Figure IX-2 through Figure IX-5 provide a graphical overview of fuel economy performance and standards. Fuel economy performance includes three parts: (1) measured performance, on the 2-cycle dynamometer test; (2) performance increases for alternative fueled vehicles, under the Alternative Motor Fuels Act of 1988 (AMFA); and (3) performance adjustments for improved A/C systems and off-cycle technologies.<sup>3020,3021,3022</sup> These Figures do not account for credits earned or expected to be earned from overcompliance in prior or future model years that were used or are available for complying with CAFE standards. Graphs are included for the total fuel economy performance (the combination of all passenger cars and light trucks produced for sale during the model year) as a single fleet, and for each of the three CAFE compliance fleets: domestic passenger car, import passenger car, and light truck fleets.

---

<sup>3020</sup> In the Figures, the label “CAFE with Capped AMFA” represents the maximum increase each year in the average fuel economy set to the limitation “cap” for manufacturers attributable to dual-fueled automobiles as prescribed in 49 U.S.C. 32906. The labels “A/C” and “off-cycle” represents the increase in the average fuel economy adjusted for A/C and off-cycle fuel consumption improvement values as prescribed by 40 CFR 600.510-12.

<sup>3021</sup> The Alternative Motor Fuels Act (AMFA) allows manufacturers to increase their fleet fuel economy performance values by producing dual-fueled vehicles. Incentives are available for building advanced technology vehicles such as hybrids and electric vehicles, compressed natural gas vehicles and for building vehicles able to run on dual-fuels such as E85 and gasoline. For MYs 1993 through 2014, the maximum possible increase in CAFE performance is “capped” for a manufacturer attributable to dual-fueled vehicles at 1.2 miles per gallon for each model year and thereafter decreases by 0.2 miles per gallon each model year through MY 2019. 49 U.S.C. 32906.

<sup>3022</sup> Consistent with applicable law, NHTSA established provisions starting in MY 2017 allowing manufacturers to increase fuel economy performance-based on fuel consumption benefits gained by technologies not accounted for during normal 2-cycle EPA compliance testing (called “off-cycle technologies” for technologies such as stop-start systems) as well as for A/C systems with improved efficiencies and for hybrid or electric full-size pickup trucks.

Figure IX-2 – Total Fleet Compliance Overview for MYs 2011 to 2019

Figure IX-3 – Domestic Passenger Car Compliance Overview for MYs 2011 to 2019

**Figure IX-4 – Import Passenger Car Compliance Overview for MYs 2011 to 2019**

**Figure IX-5 – Light Truck Compliance Overview for MYs 2011 to 2019**

As shown in Figure IX-2, manufacturers’ fuel economy performance for the total fleet was better than the overall CAFE standard through MY 2015. On average, the total fleet

exceeded the overall CAFE standards by approximately 0.9 mpg for MYs 2011 to 2015. Comparatively, as shown in **Figure IX-3** through Figure IX-5, for these same model years, domestic and import passenger cars exceeded standards on average by 2.1 mpg and 2.3 mpg, respectively. By contrast, for light trucks, manufacturers on average fell below standards by 0.3 mpg.

For MYs 2016 through 2019, as shown in the Figures, NHTSA has determined that the combined CAFE performance, including all flexibilities and incentives, of the total fleet has or is expected to be worse than the applicable CAFE standards, and increasingly so. The domestic passenger car fleet is the only compliance category expected to continue to be better than CAFE standards through MY 2018. But even the overall domestic passenger car fleet is expected to be worse than standards in MY 2019. The data show MYs 2016 through 2019 standards involve significant compliance challenges for many vehicle manufacturers. This is evident in the fact that the total fleet falls below the applicable CAFE standards on average by 0.6 mpg for these model years. Compliance challenges become even more substantial when observing individual compliance fleets. The largest individual performance shortfalls (i.e. the difference between CAFE performance values and standards) exist for import passenger car manufacturers, with an expected shortfall of 2.5 mpg in MY 2019, followed by light truck manufacturers, with a shortfall of 1.4 mpg in MY 2016.

Table IX-5 provides the numerical final CAFE performance values and standards for MYs 2004 to 2017. Notably, there was an increase in total fleet fuel economy of only 0.1 mpg for MY 2014, and no increase for MY 2016. In MY 2016, the total fleet's performance fell below the CAFE standard by 0.5 mpg. An increase in the total fleet's CAFE performance for MY 2017 was largely due to manufacturers gaining benefits from A/C and off-cycle

technologies. For MY 2017, the total fleet’s CAFE performance without A/C and off-cycle allowances increased by 0.1 mpg compared to MY 2016. However, even combined with new flexibilities, the total fleet’s CAFE performance, for MY 2017, still falls below the CAFE standard by 0.4 mpg.

**Table IX-5 – CAFE Performance and Standards for MYs 2004 to 2017**

Model Year	Domestic Passenger Car		Import Passenger Car		Light Truck		Total Fleet	
	CAFE (mpg)	Standard (mpg)	CAFE (mpg)	Standard (mpg)	CAFE (mpg)	Standard (mpg)	CAFE (mpg)	Standard (mpg)
2017	39.2	38.5	39.7	39.6	28.6	29.4	33.4	33.8
2016	37.3	36.5	38.2	37.4	27.4	28.8	32.2	32.7
2015	37.2	35.2	37.3	35.8	27.3	27.6	32.2	31.6
2014	36.3	34.0	36.9	34.6	26.5	26.3	31.7	30.5
2013	36.1	33.2	36.8	33.9	25.7	25.9	31.6	30.3

Figure IX-6 provides a historical overview of the industry’s use of CAFE compliance flexibilities for addressing performance shortfalls.<sup>3023</sup> MY 2016 is the latest model year for which CAFE compliance determinations are complete, and credit application and civil penalty payment determinations made by the manufacturer. Historically, manufacturers have generally resolved credit shortfalls first by carrying forward any earned credits and then applying traded

---

<sup>3023</sup> The Figure includes all credits manufacturers have used in credit transactions to date. Credits contained in carryback plans yet to be executed or in pending enforcement actions are not included in the Figure.

credits. In MYs 2014 and 2015, the amount of credit shortfalls is almost the same as the amount of carry-forward and traded credits. Manufacturers occasionally carryback credits or opt to transfer earned credits between their fleets to resolve performance shortfalls. Trading credits from another manufacturer and transferring them across fleets occurs far more frequently. Also, credit trading has generally taken the place of civil penalty payments for resolving performance shortfalls. Only a handful of manufacturers have made civil penalty payments since the implementation of the credit trading program.<sup>3024</sup> NHTSA expects there may be sufficient credits in manufacturers' credit accounts to resolve all import passenger car and light truck performance shortfalls expected through MY 2019. By statute, manufacturers cannot use traded or transferred credits to address performance shortfalls for failing to meet the minimum domestic passenger car standards.<sup>3025</sup> One domestic passenger car manufacturer paid civil penalties for failing to comply with the minimum domestic passenger car standards for MYs 2016 and 2017.<sup>3026</sup> Additional manufacturers are expected to pay civil penalty payments for failing to comply with the minimum domestic passenger cars standards for MYs 2018 through 2019.

---

<sup>3024</sup> Six manufacturers have paid CAFE civil penalties since credit trading began in 2011. Fiat Chrysler paid the largest civil penalty total over the period, followed by Jaguar Land Rover and then Volvo. *See* Summary of CAFE Civil Penalties Collected, CAFE Public Information Center, [https://one.nhtsa.gov/cafe\\_pic/CAFE\\_PIC\\_Fines\\_LIVE.html](https://one.nhtsa.gov/cafe_pic/CAFE_PIC_Fines_LIVE.html).

<sup>3025</sup> Congress prescribed minimum domestic passenger car standards for domestic passenger car manufacturers and unique compliance requirements for these standards in 49 USC 32902(b)(4) and 32903(f)(2).

<sup>3026</sup> Fiat Chrysler paid \$77,268,702.50 in civil penalties for MY 2016 and \$79,376,643.50 for MY 2017 for failing to comply with the minimum domestic passenger car standards for those MYs.

**Figure IX-6 – Industry Use of Compliance Flexibilities and Civil Penalty Payments**

The compliance data show that the rate at which industry has been increasing fuel economy, as shown by the actual fuel economy of the overall fleet, has not kept pace with the year-over-year increases in the stringency of the standards since MY 2010. The margin of CAFE overcompliance diminished steadily through MY 2015. In MY 2016, the fuel economy of the fleet was worse than standards, and the margin of the shortfall has or is projected to become worse through MY 2019. Manufacturers have increasingly used CAFE compliance flexibilities and paid more in civil penalties to address the growing CAFE shortfalls. The data show use of these flexibilities is likely to increase at least through 2019.

### 3. Shift in Sales Production from Passenger Cars to Light Trucks

The notable trend in the stagnant growth in the automotive industry’s CAFE performance is likely related to an increase in the purchase of light trucks beginning with MY 2013. Light trucks had a sharp spike in sales, increasing by a total of 5 percent from MYs 2013 to 2014. In

MY 2014, light trucks comprised approximately 41 percent of the total sales production volume of automobiles and has continued to grow ever since. In comparison, for model year 2014, domestic passenger cars represented 36 percent of the total fleet and import passenger cars represented 23 percent. Both domestic and import passenger car sales have continued to fall every year since MY 2013. Figure IX-7 shows the sales production volumes of light trucks and domestic and import passenger cars for MYs 2004 to 2017. The proportion of light trucks in the fleet, being driven by consumer demand and lower fuel prices, raises some concern for the ability of that fleet to comply with future CAFE standards. Historically, light truck fleets have fallen below their associated CAFE standards and have had larger performance shortages than either import and domestic passenger car fleets. This trend is expected to continue, even with allowance for A/C and off-cycle flexibilities. For MY 2019, NHTSA expects even greater CAFE performance shortages in the light truck and import passenger car fleets than in prior model years, based upon manufacturer's MMY reports. The combined effect of these fuel economy shortages will require manufacturers to rely heavily on compliance flexibilities or pay civil penalties.

Another important factor in automobile sales production impacting CAFE performance values involves increasing trends in the volume of small SUVs and pickup trucks. These vehicles as a percentage of total fleet increased from approximately 52 percent in MY 2012 to 63 percent in MY 2017. As shown in Figure IX-8, small SUVs, with 4WD and 2WD drivetrains, in particular have surpassed the sales production volumes of all other vehicle classes over these the given model years. The number of small and standard SUVs sold in the U.S. for MY 2017 nearly doubled compared to sales in the U.S. for MY 2012. During that same period, passenger car sales production as a total of vehicle sales production decreased by approximately 11 percent.

The combination of low gas prices and the increased utility that SUVs provide may explain the shift in sales production. Nonetheless, if the sales of these small SUVs and pickup trucks continue to increase, NHTSA expects there will be continued stagnation in the CAFE performance of the overall fleet.

**Figure IX-7 – Sales Production Volumes for MYs 2004 to 2017**

**Figure IX-8 – Vehicle Class Production Changes for MYs 2012 to 2017**

4. Vehicle Classification

Before manufactures can comply with CAFE and CO<sub>2</sub> standards, they must first determine how a vehicle is classified in accordance with 49 CFR Part 523, “Vehicle Classification.” In EPCA, Congress designated some vehicles as passenger automobiles and some as non-passenger automobiles. Vehicle classification, for purposes of the light-duty CAFE and CO<sub>2</sub> programs, refers to whether a vehicle is classified as a passenger automobile (car) or a

non-passenger automobile (light truck).<sup>3027, 3028</sup> As discussed previously, passenger cars and light trucks are subject to different fuel economy and CO<sub>2</sub> standards, and light trucks have less stringent standards to accommodate their utility usage.

Under EPCA and NHTSA's current regulations, vehicles are classified as light trucks either on the basis of off-highway capability or on the basis of having truck-like (utility) characteristics.<sup>3029, 3030, 3031</sup> Determining whether a vehicle is capable of "off-highway operation" is a two-part determination: first, does the vehicle either have 4-wheel drive or a gross vehicle weight rating (GVWR) over 6,000 pounds, and second, does the vehicle (that has either 4-wheel drive or over 6,000 pounds GVWR) also have "a significant feature ... designed for off-highway operation."<sup>3032</sup> NHTSA's current regulations specify that this "significant feature" requires the vehicle to meet at least four out of five ground clearance dimensions.<sup>3033</sup> Further, to be classified as a light truck on the basis of having truck-like characteristics instead, NHTSA regulations also require the vehicle to perform at least one of the following functions: carry more than 10 persons, provide temporary living quarters, have an open bed (*i.e.*, a pickup truck),

---

<sup>3027</sup> See 40 CFR 86.1803-01. For the MYs 2012–2016 standards, the MYs 2017–2025 standards, and this rule, EPA uses NHTSA's regulatory definitions for determining which vehicles would be subject to which CO<sub>2</sub> standards.

<sup>3028</sup> EPCA uses the terms "passenger automobile" and "non-passenger automobile;" NHTSA's regulation on vehicle classification, 49 CFR part 523, further clarifies the EPCA definitions and introduces the term "light truck" as a plainer language alternative for "non-passenger automobile."

<sup>3029</sup> 49 USC 32901(a)(18); 49 CFR part 523.

<sup>3030</sup> 49 CFR 523.5(b).

<sup>3031</sup> 49 CFR 523.5(a).

<sup>3032</sup> 49 U.S.C. 32901(a)(18).

<sup>3033</sup> The ground clearance dimensions are: (i) approach angle of not less than 28 degrees; (ii) breakover angle of not less than 14 degrees; (iii) departure angle of not less than 20 degrees; (iv) running clearance of not less than 20 centimeters; and/or (v) front and rear axle clearances of not less than 18 centimeters each.

provide more cargo-carrying volume than passenger-carrying volume, or permit expanded cargo volume capacity by the removal or stowing of rear seats.<sup>3034</sup>

Over time, NHTSA has revised its light truck vehicle classification regulations and issued legal interpretations to address changes in vehicle designs. Based upon agency observations of current vehicle design trends, compliance testing and evaluation, and discussions with stakeholders, NHTSA has become aware of certain additional design changes that further complicate light truck classification determinations for the CAFE and CO<sub>2</sub> programs. NHTSA discussed several classification issues in the NPRM and sought comments on potential resolutions. Only a few comments were received, primarily from vehicle manufacturers, and they were aimed generally at requesting flexibility in how NHTSA applies the existing classification criteria. A summary of the comments received and NHTSA's responses for the final rule are explained in the following sections.

*a) Classification Based on "Truck-Like Characteristics"*

One of the "truck-like characteristics" that allows manufacturers to classify vehicles as light trucks is having at least three rows of seats as standard equipment, as long as the design also "permit[s] expanded use of the automobile for cargo-carrying purposes or other non-passenger-carrying purposes through the removal or stowing of foldable or pivoting seats so as to create a flat, leveled cargo surface extending from the forwardmost point of installation of those seats to the rear of the automobile's interior."<sup>3035</sup> Typically, most minivans qualify under the

---

<sup>3034</sup> By statute, vehicles that NHTSA, on behalf of the Secretary of DOT, "decides by regulation [are] manufactured primarily for transporting not more than 10 individuals" are passenger automobiles. 49 U.S.C. 32901(a)(18).

<sup>3035</sup> 49 CFR 523.5(a)(5)(ii).

provision by expanding the cargo area through removable or stowable seats, and a small percentage of sports utility vehicles qualify through folding seats that use the seat backs to form a secondary “raised” cargo floor.<sup>3036</sup> NHTSA identified two issues with this criterion that various manufacturers appear to be approaching differently. Both relate to how expanded cargo area is provided when seats are removed or stowed in the vehicle.

The first issue is how to identify the “forwardmost point of installation” and how the location impacts the available cargo floor area and volume behind the seats. Seating configurations have evolved considerably over the last twenty years, as minivan seats are now very complex in design, providing far more ergonomic functionality. For example, the market demand for increased rear seat leg room has resulted in adjustable second row seats mounted to sliding tracks. Earlier seating designs had fixed attachment points on the vehicle floor, and it was easy to identify the “forwardmost point of installation” because it was readily observable and did not change. When seats move forward and backward on sliding tracks, however, the “forwardmost point of installation” is less readily identifiable. To avoid this complication, most manufacturers maintain light truck qualification by using adjustable seats that can be removed from the vehicle and having a flat floor rearward of the front seats.<sup>3037</sup> For others, the qualification is not as apparent because new adjustable seats have been introduced that remain within vehicle to accommodate side airbags. Manufacturers designate various positions for the forwardmost point of installation in vehicles where the seat in the sliding track can be moved far

---

<sup>3036</sup> All minivans and a small percentage of sports utility vehicles that qualify as light trucks do so by meeting the characteristic for third row seats. As more advanced seating designs are introduced in minivans, manufacturers that wish to retain this status will need to avoid losing the expanded cargo characteristics that are the basis for the allowing minivans to be qualified as light trucks.

<sup>3037</sup> NHTSA notes that to qualify as a light truck, a vehicle still requires a flat floor from the forwardmost point of installation of removable second row seats to the rear of the vehicle.

enough forward to allow the entire seat to compress against the back of the front seat where it can be stowed beyond the forwardmost point of installation, while the seat cushion bottom folds towards the seatback. In some cases, manufacturers designate the forwardmost point of installation at a location in the sliding track where the seat is positioned at its *rearmost* position in the track. In others, the initial point of installation is designated at a location in the sliding track accommodating the seating position of a 75-percentile male test dummy. The amount of the flat floor surface area and cargo volume behind the seats can vary depending on which approach a manufacturer adopts.

NHTSA sought public comments in the NPRM to explore potential options for establishing the forwardmost point of installation for adjustable second row seats and to evaluate whether an additional classification criteria could be required, specifying a minimum amount of cargo volume behind the seats. Comments were received from the Auto Alliance and Fiat Chrysler.<sup>3038</sup> Both the Auto Alliance and Fiat Chrysler commented that some flexibility is needed in determining the forwardmost point of installation that allows manufacturers to set the location of the seat attachment point to the sliding track in any manufacturer-designated position that allows for customer-ergonomics and safety, while still meeting the spirit of the expanded cargo-carrying requirement.<sup>3039</sup> The Auto Alliance further commented that the forwardmost attachment point of the seat structure to the floor is still a viable method of measurement, even when there is a sliding track between the floor attachment point and the seat.<sup>3040</sup>

---

<sup>3038</sup> The National Automobile Dealers Association commented generally that it does not support any substantial modifications to the existing passenger car and light truck fleet definitions.

<sup>3039</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073; Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943.

<sup>3040</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

NHTSA did not propose any vehicle reclassifications and is not adopting a regulatory change at this time. Based on its review of the comments, NHTSA agrees that flexibility is warranted to accommodate safety and customer demand but clarifies that the regulation requires seats that are not removed to be stowed—that is, moved so as to form a cargo area behind the seats. Manufacturers can freely designate the seating location in the sliding track to establish the forwardmost point of installation. At that seat location, the forwardmost point of installation is the forwardmost attachment point of the seat structure (including any carriage structures) to the floor in the sliding track. Vehicles will be considered to meet the characteristic provided the rear of the seats can be moved forward beyond that point and the seats articulate to an unusable stowed position either in the floor of the vehicle or at the front perimeter of expanded cargo area.<sup>3041</sup>

The second issue concerns the “flatness” and “levelness” of folded rear seats that use the seat backs to form a raised cargo surface and whether the seats must form a continuous flat, leveled surface. Many SUVs have three rows of designated seating positions, where the second row has “captain’s seats” (*i.e.*, two independent bucket seats), rather than the traditional bench-style seating more common when the provision was added to NHTSA’s regulation. When captain’s seats are folded down, the seatback can form a flat surface for expanded cargo-carrying purposes, but the surface of the seatbacks may be angled (*i.e.*, at some angle slightly greater than 0°), or may be at a different level with the rest of the cargo area (*i.e.*, horizontal surface of folded seats is 0° at a different height from horizontal surface of cargo area behind the seats). Captain’s

---

<sup>3041</sup> The front perimeter of the cargo area is the plane formed behind the front seats and extending from one side of the vehicle to the other.

seats, when folded flat, may also leave significant gaps around and between the seats. Some manufacturers have opted to use plastic panels to level the surface and to covers the gaps between seats, while others have left the space open and the surface angled or at different levels. NHTSA sought comments in the NPRM on the following questions related to the requirement for a flat, leveled cargo surface:

- Does the cargo surface need to be flat and level in exactly the same plane, or does it fulfill the intent of the criterion and provide appropriate cargo-carrying functionality for the cargo surface to be other than flat and level in the same plane?
- Does the cargo surface need to be flat and level across the entire surface, or are (potentially large) gaps in that surface consistent with the intent of the criterion and providing appropriate cargo-carrying functionality? Should panels to fill gaps be required?
- Certain third row seats are located on top the rear axle causing them to sit higher and closer to the vehicle roof. When these seats fold flat the available cargo-carrying volume is reduced. Is cargo-carrying functionality better ensured by setting a minimum amount of useable cargo-carrying volume in a vehicle when seats fold flat?

The Auto Alliance, Fiat Chrysler, Hyundai, Kia, and one individual, Walter Kreucher, commented on these seating issues. The Auto Alliance, Fiat Chrysler, and Walter Kreucher believed that the criteria for a “flat, leveled cargo surface” should not be interpreted to mean that a cargo surface must be flat and level in exactly the same plane.<sup>3042</sup> The comments noted that a

---

<sup>3042</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073; Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943; Walter Kreucher, Detailed Comments, NHTSA-2018-0067-0444.

surface that is not exactly flat and level in the same plane can still provide substantial cargo-carrying capacity, while allowing manufacturers to provide ergonomically comfortable seats that meet safety requirements.<sup>3043</sup> The comments stated that NHTSA should not establish a minimum amount of cargo surface area for seats that remain within the vehicle.<sup>3044</sup> Instead, they preferred that manufacturers should be allowed to determine the methodology for providing appropriate cargo-carrying functionality without NHTSA stipulating additional requirements for flat and level surfaces or gaps and gap-filling panels.<sup>3045</sup>

The Auto Alliance and Fiat Chrysler argued that area or volume requirements are not needed, as those attributes speak to overall vehicle size and shape, which should remain a consumer choice.<sup>3046</sup> The requirements for expanded cargo- or other non-passenger-carrying purposes are fully met in the existing regulation, which requires a flat, leveled cargo surface with two rows of seats that are folded or stowed. Fiat Chrysler also commented that potential new requirements would likely be interpreted and executed differently across manufacturers and could narrow the choice of engineering solutions and negatively affect other important vehicle attributes.<sup>3047</sup>

Hyundai and Kia commented that instead of requiring panels, NHTSA could limit the size of the gaps around and between folded seats.<sup>3048</sup> In that case, manufacturers would have

---

<sup>3043</sup> See, e.g., Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943.

<sup>3044</sup> See, e.g., Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

<sup>3045</sup> See, e.g., Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943.

<sup>3046</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073; Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943.

<sup>3047</sup> Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943.

<sup>3048</sup> Hyundai, Detailed Comments, EPA-HQ-OAR-2018-0283-4411; Kia, Detailed Comments, EPA-HQ-OAR-2018-0283-4195.

flexibility to use panels if they wish but could take other measures to narrow gaps. On the other hand, Walter Kreucher stated that NHTSA should allow gaps of any size and not require the use of panels to cover them.<sup>3049</sup>

NHTSA is not adopting a regulatory change at this time. NHTSA agrees with commenters that it should not require a minimum amount of cargo surface area or volume for seats that remain within the vehicle, which could be difficult to meet for certain vehicle sizes and shapes that would otherwise be considered non-passenger vehicles. NHTSA agrees that the amount of cargo volume should be a consumer choice. Setting a minimum amount of cargo area or volume could have an adverse effect on potential new car buyers.

NHTSA notes that there may also be safety considerations involved with the requirement to have a flat, leveled cargo surface area formed by seat backs. A flat, leveled cargo surface area could prevent objects from having a ramp-like surface to gain momentum in rolling backwards into the tailgate's interior surface, potentially causing stress or damage on the tailgate's latching mechanism. For these reasons, several standards exist in the industry for preventing objects from sliding, such as standards from the American Disability Act (ADA) that specify floor and ground design requirements for protecting wheelchair seated occupants. In addition, objects resting on the tailgate could become a hazard or source of injury for individuals opening the tailgate. At this time, NHTSA accepts the commenters' position that having a cargo surface area that is exactly flat and level in the same plane may not be necessary. Comments did not provide enough information for NHTSA to identify any changes to the existing requirements. Therefore,

---

<sup>3049</sup> Kreucher, Detailed Comments, NHTSA-2018-0067-0444.

at this time, NHTSA will retain its existing provisions for the stowing of foldable or pivoting seats to create a flat, leveled cargo surface, but NHTSA may consider conducting research in the future regarding these issues. NHTSA has also determined that it should set not a limit on the size of the gaps between folded seats at this time, although it may consider adopting such limits in the future. NHTSA continues to encourage manufacturers to consider the safety implications of all aspects of their vehicle designs, including any angling of the seat back cargo surface and whether it is appropriate to offer panels as optional equipment for covering any large gap openings.

*b) Issues that NHTSA has Observed Regarding Classification Based on “Off-Road Capability”*

*(1) Measuring Vehicle Characteristics for Off-Highway Capability*

For a vehicle to qualify as off-highway capable, in addition to either having 4WD or a GVWR more than 6,000 pounds, the vehicle must have four out of five characteristics indicative of off-highway operation.<sup>3050</sup> These characteristics are:

- An approach angle of not less than 28 degrees
- A breakover angle of not less than 14 degrees
- A departure angle of not less than 20 degrees
- A running clearance of not less than 20 centimeters

---

<sup>3050</sup> 49 CFR 523.5(b)(2).

- Front and rear axle clearances of not less than 18 centimeters each

NHTSA's regulations require manufacturers to measure these characteristics when a vehicle is at its curb weight, on a level surface, with the front wheels parallel to the automobile's longitudinal centerline, and the tires inflated to the manufacturer's recommended cold inflation pressure.<sup>3051</sup> Given that the regulations describe the vehicle's physical position and characteristics at time of measurement, NHTSA previously assumed that manufacturers would use physical measurements of vehicles. In practice, NHTSA has instead received from manufacturers a mixture of angles and dimensions from design models (*i.e.*, the vehicle as designed, not as actually produced) and/or physical vehicle measurements.<sup>3052</sup> When appropriate, the agency will verify reported values by measuring production vehicles in the field. NHTSA currently requires that manufacturers use physical vehicle measurements as the basis for values reported to the agency for purposes of vehicle classification. NHTSA sought comment on whether regulatory changes are needed with respect to this issue.

(2) *Approach, Breakover, and Departure Angles*

Approach angle, breakover angle, and departure angle are relevant to determining off-highway capability. Large approach and departure angles ensure the front and rear bumpers and valance panels have sufficient clearance for obstacle avoidance while driving off-road. The breakover angle ensures sufficient body clearance from rocks and other objects located between the front and rear wheels while traversing rough terrain. Both the approach and departure angles

---

<sup>3051</sup> *Id.*

<sup>3052</sup> NHTSA previously encountered a similar issue when manufacturers reported CAFE footprint information. In the October 2012 final rule, NHTSA clarified manufacturers must submit footprint measurements based upon production values. 77 FR 63138 (October 15, 2012).

are derived from a line tangent to the front (or rear) tire static loaded radius arc extending from the ground near the center of the tire patch to the lowest contact point on the front or rear of the vehicle. The term “static loaded radius arc” is based upon the definitions in SAE J1100 and J1544. The term is defined as the distance from wheel axis of rotation to the supporting surface (ground) at a given load of the vehicle and stated inflation pressure of the tire (manufacturer’s recommended cold inflation pressure).<sup>3053</sup>

The static loaded radius arc is easy to measure, but the imaginary line tangent to the static loaded radius arc is difficult to ascertain in the field. The approach and departure angles are the angles between the line tangent to the static loaded radius arc and the level ground on which the test vehicle rests. Simpler measurements that provide good approximations for the approach and departure angles involve using either a line tangent to the outside diameter or perimeter of the tire or a line that originates at the geometric center of the tire contact patch and extends to the lowest contact point on the front or rear of the vehicle. The first method provides an angle slightly greater than, and the second method provides an angle slightly less than, the angle derived from the true static loaded radius arc. Both approaches can be used to measure angles in the field to verify data submitted by the manufacturers used to determine light truck classification decisions.

NHTSA sought comment on what the effect would be if it replaced reference to the “static loaded arc radius” with a different term like “outside perimeter of the tire” or “geometric center of the tire contact patch.” The Auto Alliance and Fiat Chrysler offered comments. The

---

<sup>3053</sup> 49 CFR 523.2.

Auto Alliance and Fiat Chrysler commented that only a measurement using the static loaded arc radius reasonably reflects the tire condition during off-road events that approach, breakover, and departure angles are quantifying. They also stated the static loaded arc radius best reflects the actual condition that exists versus the outside tire diameter.<sup>3054</sup> Finally, the Auto Alliance commented the static loaded arc radius is easy to measure; therefore, the off-road criteria should remain tied to the static loaded arc radius.<sup>3055</sup>

After reviewing the comments, NHTSA agrees that the static loaded arc radius is the most accurate way to account for the condition of the tire and the vehicle-to-ground interaction during off-road events. NHTSA has decided to accept the Auto Alliance's and Fiat Chrysler's views and will retain the existing definitions for off-road angles based upon the static loaded arc radius.

### (3) *Running Clearance*

NHTSA regulations define “running clearance” as “the distance from the surface on which an automobile is standing to the lowest point on the automobile, excluding unsprung weight.”<sup>3056</sup> Unsprung weight includes the components (*e.g.*, suspension, wheels, axles, and other components directly connected to the wheels and axles) that are connected and translate with the wheels. Sprung weight, on the other hand, includes all components fixed underneath the vehicle and translate with the vehicle body (*e.g.*, mufflers and subframes). To clarify these

---

<sup>3054</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073; Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943.

<sup>3055</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

<sup>3056</sup> *Id.*

requirements, NHTSA previously issued a letter of interpretation stating that certain parts of a vehicle—such as tire aero deflectors that are made of flexible plastic, bend without breaking, and return to their original position—would not count against the 20-centimeter running clearance requirement.<sup>3057</sup> The agency explained that this does not mean a vehicle with less than 20-centimeters running clearance could be elevated by an upward force that bends the deflectors and still be considered compliant with the running clearance criterion, as it would be inconsistent with the conditions listed in the introductory paragraph of 49 CFR 523.5(b)(2). Further, NHTSA explained that without a flexible component installed, the vehicle must meet the 20-centimeter running clearance along its entire underside. This 20-centimeter clearance is required for all sprung weight components.

The agency is aware of vehicle designs that incorporate rigid (*i.e.*, inflexible) air dams, valance panels, exhaust pipes, and other components, equipped as manufacturers' standard or optional equipment (*e.g.*, running boards and towing hitches), that likely do not meet the 20-centimeter running clearance requirement. Despite these rigid features, it appears manufacturers are not taking these components into consideration when making measurements. Additionally, NHTSA believes some manufacturers may provide dimensions for their base vehicles without considering optional or various trim level components that may reduce the vehicle's ground clearance. Consistent with our approach to other measurements, NHTSA believes that ground clearance, as well as all the other off-highway criteria for a light truck determination, should use the measurements from vehicles with all standard and optional equipment installed, at the time of

---

<sup>3057</sup> See letter to Mark D. Edie, Ford Motor Company, July 30, 2012, available at [https://isearch.nhtsa.gov/files/11-000612%20M.Edie%20\(Part%20523\).htm](https://isearch.nhtsa.gov/files/11-000612%20M.Edie%20(Part%20523).htm).

the first retail sale.<sup>3058</sup> The agency reiterates that the characteristics listed in 49 CFR 523.5(b)(2) are characteristics indicative of off-highway capability. A fixed feature—such as an air dam that does not flex and return to its original state or an exhaust that could detach—inherently interferes with the off-highway capability of these vehicles. If manufacturers seek to classify these vehicles as light trucks under 49 CFR 523.5(b)(2) and the vehicles do not meet the four remaining characteristics to demonstrate off-highway capability, they must be classified as passenger cars.

In the NPRM, NHTSA sought public comments on how to consider components such as air dams, exhaust pipes, and other hanging component features—especially those that are inflexible—as relates to running clearance and whether the agency should consider amending its definition in Part 523 to account for these components. The Auto Alliance and three automobile manufacturers—Fiat Chrysler, Hyundai, and Kia—commented on the questions. The Auto Alliance and Fiat Chrysler commented that no change is needed for the 20-centimeter running clearance requirement for fixed features of the vehicle; all fixed components must have 20-centimeter of running clearance.<sup>3059</sup> They agreed that flexible components that bend without breaking and return to their original position do not count against the 20-centimeter running clearance requirement.<sup>3060</sup> They disagreed with NHTSA’s position that these requirements should apply to all vehicles with standard and optional equipment installed at the time of the first

---

<sup>3058</sup> See NHTSA’s footprint test procedure for verifying CAFE standards uses vehicles equipped at time of first retail sale. See TP-537-01 located at <https://www.nhtsa.gov/vehicle-manufacturers/test-procedures>.

<sup>3059</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073; Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943.

<sup>3060</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073; Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943.

retail sale and proposed instead that the requirement should be “as shipped to the dealer.”<sup>3061</sup> Additionally, the Auto Alliance asked NHTSA to make a specific allowance for vehicles that have adjustable ride height, such as air suspension, and permit the running clearance and other off-road clearance measurements to be made in the lifted or off- road mode.<sup>3062</sup> Hyundai and Kia urged NHTSA not to modify the definition of “running clearance,” which currently is defined as “the distance from the surface on which an automobile is standing to the lowest point on the automobile, excluding unsprung weight.”<sup>3063</sup>

Based upon the comments above, NHTSA has decided to retain its running clearance requirements for qualifying light trucks without change. First, running clearance means the distance from the surface on which an automobile is standing to all fixed components under the vehicle, excluding unsprung components, axle clearance components and flexible components that bend without breaking and returning to their original position as explained in NHTSA’s previous interpretation. Second, NHTSA acknowledges that at this time, during validation testing for running clearance, a vehicle with optional equipment installed will only be tested “as shipped to the dealer.” NHTSA has found that optional equipment can impact a vehicle’s ability to comply with running clearance requirements, while optional equipment must be considered for other light truck agency validation tests unless the equipment has no impact on the outcome of the test.

(4) *Front and Rear Axle Clearance*

NHTSA regulations state that front and rear axle clearances of not less than 18 centimeters are another criterion that can be used for designating a vehicle as off-highway capable.<sup>3064</sup> The agency defines “axle clearance” as the vertical distance from the level surface on which an automobile is standing to the lowest point on the axle differential of the automobile.<sup>3065</sup>

The agency believes this definition may be outdated because of vehicle design changes, including axle system components and independent front and rear suspension components. In the past, traditional light trucks with and without 4WD systems had solid rear axles with center-mounted differentials on the axle. For these trucks, the rear axle differential was closer to the ground than any other axle or suspension system component. This traditional axle design still exists today for some trucks with a solid chassis (also known as body-on-frame configuration). Today, however, many SUVs and CUVs that qualify as light trucks are constructed with a unibody frame and have unsprung (*e.g.*, control arms, tie rods, ball joints, struts, shocks, etc.) and sprung components (*e.g.*, the axle subframes) connected together as a part of the axle assembly.<sup>3066</sup> These unsprung and sprung components are located under the axles, making them lower to the ground than the axles and the differential, and were not contemplated when NHTSA established the definition and the allowable clearance for axles. The definition also did not originally account for 2WD vehicles with GVWRs greater than 6,000 pounds that had one axle

---

<sup>3064</sup> 49 CFR 523.5(b)(2)(v).

<sup>3065</sup> 49 CFR 523.2.

<sup>3066</sup> Unibody frames integrate the frame and body components into a combined structure.

without a differential, such as the model year 2018 Ford Expedition. Vehicles with axle components that are low enough to interfere with the vehicle's ability to perform off-road would seem inconsistent with the regulation's intent of ensuring off-highway capability, as Congress required.<sup>3067</sup>

In light of these issues, comments were sought in the NPRM on whether (and if so, how) to revise the definition of axle clearance. NHTSA sought comments on what unsprung axle components should be considered when determining a vehicle's axle clearance. The agency questioned whether the definition for axle clearance should be modified to account for axles without differentials. NHTSA also sought comment on whether the axle subframes surrounding the axle components but affixed directly to the vehicle unibody as sprung mass (lower to the ground than the axles) should be considered in the allowable running clearance discussed above. Finally, NHTSA sought comments on whether it should consider replacing both the running and axle clearance criteria with a single ground clearance criterion that considers all components underneath the vehicle that impact a vehicle's off-road capability.

Comments were received from the Auto Alliance, Fiat Chrysler, Hyundai, and Kia. All the manufacturers that commented claimed no change is needed to the current definition, regardless of whether the axle components are sprung or unsprung masses, as the bottom of the differential is the vulnerable component.<sup>3068</sup> The Auto Alliance also stated there is no need to further modify the definition to account for axles without differentials. Further, the Auto

---

<sup>3067</sup> 49 U.S.C. 32901(a)(18)(A).

<sup>3068</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073; Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943; Hyundai, Detailed Comments, EPA-HQ-OAR-2018-0283-4411; Kia, Detailed Comments, EPA-HQ-OAR-2018-0283-4195.

Alliance does not think a single criterion that considers all components under the axle is needed and prefers to keep the existing regulation.<sup>3069</sup> Fiat Chrysler and the Auto Alliance also recommended that 2WD SUVs and CUVs be reclassified back into the truck fleet, where they had been placed prior to the 2011 MY. Their position is that 2WD SUVs are designed to meet the “off-road-capable” definition in NHTSA’s rules by having the required running and/or axle clearances as well as meeting other off-road dimensional criteria.<sup>3070</sup> Hyundai stated that changing the point of measurement now would have significant development and economic impacts.<sup>3071</sup> Kia stated that it has designed its vehicles and developed product plans in reliance on the current definitions, and those designs and product plans cannot be modified cheaply or quickly.<sup>3072</sup>

NHTSA already addressed the comments on 2WD SUVs in a previous rulemaking, and NHTSA has no additional response at this time.<sup>3073</sup> Upon review of other comments, manufacturers did not clearly distinguish which parts of the axle sub-frames should be considered as sprung masses in order for NHTSA to understand if modifications are needed to its axle clearance requirements. Therefore, at this time, NHTSA is retaining its axle clearance requirements as currently specified. However, NHTSA still believes it is beneficial to continue efforts at defining those axle components that are sprung or unsprung masses before considering any changes to its regulatory provisions. In addition, NHTSA needs to understand any

significant developmental and economic impacts that might be associated with any possible changes to its requirements. Therefore, NHTSA will consider collecting further information on these issues and may take further action related to this issue in the future.

## B. EPA Compliance and Enforcement

### 1. Overview of the EPA Compliance Process

EPA established comprehensive vehicle certification, compliance, and enforcement provisions for the GHG standards as part of the rulemaking establishing the initial GHG standards for MY 2012-2016 vehicles.<sup>3074</sup> Manufacturers have been following these provisions since MY 2012 and EPA did not propose or seek comments on changing its compliance and enforcement program.

#### *a) What Compliance Flexibilities and Incentives are Currently Available Under the CO<sub>2</sub> Program and How do Manufacturers Use Them?*

Under EPA's regulations, manufacturers can use credit flexibilities to comply with CO<sub>2</sub> standards for passenger car or light truck compliance fleets. Similar to the CAFE program, manufacturers gain credits when the performance of a fleet exceeds its required CO<sub>2</sub> fleet average standard which can be carried forward for five years. EPA also allows a one-time credit carry-forward exceeding 5 years, allowing MY 2010-2015 to be carried forward through

---

<sup>3074</sup> See 75 FR 25468-25488 and 77 FR 62884-62887 for a description of these provisions. See also "The 2018 EPA Automotive Trends Report, Greenhouse Gas Emissions, Fuel Economy, and Technology since 1975," EPA-420-R-19-002 March 2019 for additional information regarding EPA compliance determinations.

MY2021. A manufacturer's fleet performance that does not meet the fleet average standard generates a credit deficit. Manufacturers can carry credit deficits forward up to three model years before having to resolve the shortfall.

NHTSA's program continues the 5-year carry-forward and 3-year carryback, as required by statute. Credit "transfer" means the ability of manufacturers to move credits from their passenger car fleet to their light truck fleet, or vice versa. As part of the EISA amendments to EPCA, NHTSA was required to establish by regulation a CAFE credit transferring program, now codified at 49 CFR part 536, to allow a manufacturer to transfer credits between its car and truck fleets to achieve compliance with the standards. For example, credits earned by over-compliance with a manufacturer's car fleet average standard could be used to offset debits incurred because the manufacturer did not meet the truck fleet average standard in a given year.

Under Section 202(a) of the CAA, there is no statutory limitation on car/truck credit transfers, and EPA's CO<sub>2</sub> program allows unlimited credit transfers across a manufacturer's car and light truck fleets to meet CO<sub>2</sub> standards.

EPA requested comment on a variety of "enhanced flexibilities" whereby EPA could make adjustments to current incentives and credit provisions and potentially add new flexibility opportunities to expand the means by which manufacturers may satisfy standards. Some of these additional flexibilities would not result in a reduction in program stringency, while others would incentivize technologies that could realize greater CO<sub>2</sub> emissions reductions over a longer term, but would result in a loss of emission benefits in the short-term, as discussed below. EPA requested comments on these topics to support the increased application of technologies that the

automotive industry is developing and deploying that could potentially lead to further long-term emissions reductions and allow manufacturers to comply with standards while reducing costs.

EPA explained that one category of flexibilities, such as off-cycle credits and credit banking, involve credits that are based on real world emissions reductions and do not represent a loss of overall emissions benefits or a reduction in program stringency, yet offer manufacturers potentially lower-cost or more efficient path to compliance. Another category of flexibilities, such as incentives for battery electric vehicles, hybrid technologies, and alternative fuels, do result in a loss of emissions benefit and represent a reduction in the effective stringency of the standards to the extent the incentives are used by manufacturers. These incentives would help manufacturers meet a numerically more stringent standard, but would not reduce real-world CO<sub>2</sub> emissions in the short term compared to a lower stringency option with fewer such incentives. EPA's policy rationale for providing such incentives, as articulated in the 2012 rulemaking, was that such programs could incentivize the development and deployment of advanced technologies with the potential to lead to greater CO<sub>2</sub> emissions reductions in the longer-term, where such technologies today are limited by higher costs, market barriers, infrastructure, and consumer awareness.<sup>3075</sup> Such incentive approaches would also result in rewarding automakers who invest in certain technological pathways, rather than being technology neutral.

Prior to the proposal, automakers and other stakeholders expressed support for this type of compliance flexibility. For example, in March 2018, Ford stated, "We support increasing clean car standards through 2025 and are not asking for a rollback. We want one set of standards

---

<sup>3075</sup> See 77 FR 62810-62826 (Oct. 15, 2012).

nationally, along with additional flexibility to help us provide more affordable options for our customers.”<sup>3076</sup> Honda, in April 2018, also expressed its support for an approach that retained the existing standards while extending the advanced technology multipliers for electrified vehicles, eliminated automakers’ responsibility for the impact of upstream emissions from the electric grid, and accommodated more off-cycle technologies.<sup>3077</sup>

EPA’s request for comments was largely based on its consideration of input from automakers and other stakeholders, including suppliers and alternative fuels industries, supporting a variety of program flexibilities.<sup>3078</sup> The following provides an overview of EPA’s request for comments on several flexibility concepts, the comments EPA received, and the agency’s response to those comments. After considering comments, EPA is not adopting new incentives in the areas of credit multipliers (with the exception of multipliers for natural gas vehicles), new incentives for hybrid vehicles, incentives for autonomous or connected vehicles, or alternative fueled vehicles other than natural gas, as part of this final rule. EPA is finalizing program changes for the treatment of upstream emissions for electric vehicles, the treatment of natural gas vehicles, the treatment of hybrid and target-beating full-size pickup trucks, and off-cycle credits, as discussed below.

<sup>3078</sup> Memorandum to docket EPA-HQ-OAR-2018-0283 regarding meetings with the Alliance of Automobile Manufacturers on April 16, 2018 and Global Automakers on April 17, 2018. EPA-HQ-OAR-2018-0283-0022.

(1) *Credit Flexibilities*

Under the EPA program, CO<sub>2</sub> credits may be carried forward, or banked, for a period of five years, with the exception that MY 2010-2015 credits may be carried forward and used through MY 2021. CO<sub>2</sub> credits may also be traded between manufacturers and transferred between passenger car and light truck fleets similar to the CAFE program, but without any adjustment for fuel savings. Under Section 202(a) of the CAA, there is no statutory limitation on credit transfers between a manufacturer's passenger car and light truck fleets, and EPA's CO<sub>2</sub> program allows unlimited credit transfers across a manufacturer's passenger car and light truck fleets to comply with CO<sub>2</sub> standards. This flexibility is based on the expectation that it will help facilitate manufacturer compliance with CO<sub>2</sub> standards in the lead time provided, and allow CO<sub>2</sub> emissions reductions to be achieved in the most cost effective way.

Automakers suggested, prior to the NPRM proposal, a variety of ways in which CO<sub>2</sub> credit life could be extended under the CAA, like allowing automakers to carry-forward MY 2010 and later banked credits to MY 2025, extending the life of credits beyond five years, or even unlimited credit life where credits would not expire. EPA requested comments in the NPRM on extending credit carry-forward under the CO<sub>2</sub> program beyond the current five years, including unlimited credit life.

General comments were received in response to the NPRM from the National Automobile Dealers Association and Volkswagen. They commented that credit carry-forward

and carryback options help with annual compliance with the CO<sub>2</sub> program.<sup>3079</sup> They stated that these mechanisms allow manufacturers to become compliant over the course of the time a credit is usable in the market.<sup>3080</sup> Toyota, General Motors, Fiat Chrysler, the Auto Alliance, and the Global Automakers each commented that CO<sub>2</sub> credits earned by manufacturers need a longer life so they may be carried forward further than the current five-year limitation.<sup>3081</sup> They asked for an unlimited period for using CO<sub>2</sub> credits without restrictions, since they argue that automakers have earned those credits and should be allowed to use them however they see fit.<sup>3082</sup> They also stated that this would incentivize manufacturers to make early reductions in CO<sub>2</sub> emissions.<sup>3083</sup> Furthermore, it was noted that credits are earned when manufacturers achieve lower CO<sub>2</sub> fleet average emissions than otherwise required by regulation in any given model year. They stated that this typically results from actions taken by a manufacturer to deploy specific models or more efficient technology than required, often at a higher cost. Such technologies reduce the amount of CO<sub>2</sub> emissions released into the atmosphere over the life of the vehicle, which could be over several decades. Therefore, the resulting credit earned by a manufacturer for having made the product or technology investment that resulted in the reduced emissions should not be limited to five years.

<sup>3082</sup> *See, e.g.*, Global Automakers, Detailed Comments, NHTSA-2018-0067-12032.

<sup>3083</sup> *See, e.g.*, General Motors, Detailed Comments, NHTSA-2018-0067-11858.

Global Automakers, the Auto Alliance, Fiat Chrysler, and Toyota requested a one-time expiration date extension through 2026 for CO<sub>2</sub> credits earned in MYs 2010-2015.<sup>3084</sup> They asserted that earned credits represent actual CO<sub>2</sub> reductions and increasing their lifespan will allow for better compliance. Conversely, Honda disagreed with the extension of MY 2010-2015 credits through 2026 because they have been selling their credits under the assumption that they would expire.<sup>3085</sup> Honda stated that shorter life (soon to expire) credits are worth less than longer life credits, leading to a disadvantage for manufacturers who have already sold these credits at a lower price. Honda asserted that the one-time extension would benefit only a few automakers.<sup>3086</sup> However, Honda did agree that a one-time extension through 2026 for MYs 2016-2020 CO<sub>2</sub> credits would assist with compliance because these credits have yet to be involved in trades.<sup>3087</sup>

In sum, commenters requested either unlimited allowances to carry-forward surplus credits without any expiration date, a one-time expiration date extension through 2026 for CO<sub>2</sub> credits earned from MY 2010 and later, or consideration for extending credit life longer than the current five-year provision. After considering the comments received, EPA has decided not to change its credit carry-forward provisions at this time, and will retain the credit carry-forward period under the CO<sub>2</sub> program at five years for credits generated in MYs 2016 and later. EPA does not believe any changes to its credit carry-forward provisions are warranted. EPA notes that NHTSA's CAFE program is constrained by statute to a five-year carry-forward so if EPA

<sup>3084</sup> Global Automakers, Detailed Comments, NHTSA-2018-0067-12032; Alliance, Detailed Comments, NHTSA-2018-0067-12073; Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943; Toyota Detailed Comments, NHTSA-2018-0067-12150.

<sup>3085</sup> Honda, Detailed Comments, NHTSA-2018-0067-11818.

<sup>3086</sup> Honda, Detailed Comments, NHTSA-2018-0067-11818.

<sup>3087</sup> Honda, Detailed Comments, NHTSA-2018-0067-11818.

adopted a longer carry-forward period, it might be of limited use since the level of stringency of the CO<sub>2</sub> and CAFE standards is similar across the programs. Also, the analysis on which the tailpipe CO<sub>2</sub> emissions standards finalized today are based, assumed a five-year carry-forward period for credits.

Another reason for denying manufacturers' requests is the potential inequitable advantage a longer credit life could have for manufacturers with surplus credits, especially those with significant amounts of credits currently banked for multiple model years. Manufacturers without credits, or manufacturers who have already sold their credits at current market values based on the present five-year carry-forward credit lifespan, as Honda discussed, will be significantly disadvantaged.<sup>3088</sup> These manufacturers are unlikely to be able to renegotiate the price of credit trades already made. Manufacturers with large amounts of credits would clearly be advantaged and able to distort the market in ways unfavorable to the goal of reducing emissions. EPA is concerned that these manufacturers will be able to create uncertainties in the market by being able to infuse large volumes of credits into future model years where it may even be possible to delay some cost-effective technologies from entering production because manufacturers are relying upon these credits as an alternative pathway to compliance.

(2) *Advanced Technology Incentives*

The existing EPA CO<sub>2</sub> program provides incentives for electric vehicles, fuel-cell vehicles, plug-in hybrid vehicles, and natural gas vehicles. The 2012 rulemaking allowed manufacturers to use a 0 grams/mile emissions factor for all electric powered vehicles rather than

---

<sup>3088</sup> Honda, Detailed Comments, NHTSA-2018-0067-11818.

having to account for the CO<sub>2</sub> emissions associated with upstream electricity generation, up to a per-manufacturer cumulative production cap for MYs 2022-2025. The program also includes multiplier incentives that allow manufacturers to count advanced technology vehicles as more than one vehicle in the compliance calculations. The multipliers began with MY 2017 and end after MY 2021.<sup>3089</sup> Prior to the proposal, stakeholders suggested that these incentives should be expanded to support further the production of advanced technologies by allowing manufacturers to continue to use the 0 grams/mile emissions factor for electric powered vehicles rather than having to account for upstream electricity generation emissions and by extending and potentially increasing the multiplier incentives.

First, EPA requested comments on extending the use of 0 grams/mile emissions factor for electric powered vehicles.

The Auto Alliance, Global Automakers, and several manufacturers commented that upstream utility emissions come from power plants, not vehicle tailpipes, and manufacturers have no control over the feedstock used by those power plants and should not be held responsible for their upstream electricity emissions.<sup>3090</sup> The Auto Alliance further commented that removing upstream accounting is not an incentive for advanced technology vehicles; rather, it should be seen as a correction to remove responsibility for emissions over which the automakers have no control.<sup>3091</sup> Fiat Chrysler commented that “requiring upstream accounting could impede development of BEVs or PHEVs, as accounting of upstream emissions degrades the CO<sub>2</sub>

---

<sup>3089</sup> The multipliers are for EV/FCVs: 2017–2019—2.0, 2020—1.75, 2021—1.5; for PHEVs and dedicated and dual-fuel CNG vehicles: 2017–2019—1.6, 2020—1.45, 2021—1.3.

<sup>3090</sup> *See, e.g.*, Volkswagen, Detailed Comments, NHTSA-2017-0069-0583.

<sup>3091</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

performance of BEVs to the level of PHEVs, and PHEVs to the level of a conventional hybrid electric vehicle. This, in effect, disincentivizes the technology.”<sup>3092</sup>

Several other commenters also supported not counting upstream emissions and instead only counting electric powered vehicle tailpipe emissions of 0 grams/mile.<sup>3093</sup> These commenters included NCAT, SAFE, BorgWarner, CALSTART, Eaton, and Edison Electric Institute.

API did not support continuing the 0 grams/mile emission factor for electricity use, commenting that by failing to factor the real contribution of upstream CO<sub>2</sub> emissions from electric generation, the regulatory agencies would distort the market for developing transportation fuel alternatives.<sup>3094</sup> API commented that EPA should not ignore the environmental burden of upstream emissions in granting production incentives to automakers.

Manufacturers of Emission Controls Association (MECA) commented that “with the growing emphasis on real-world emission reductions, it becomes increasingly important to consider all emissions to the environment, including upstream emissions. Numerous studies have shown that in many parts of the country, the temporary 0 grams/mile upstream emissions factor is not delivered in the real-world ... MECA believes that EPA should continue to set performance-based standards that assess technology pathways based on delivering the intended emission reductions over the full well-to-wheels vehicle life cycle in the real-world.”<sup>3095</sup> Motor

---

<sup>3092</sup> Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943.

<sup>3093</sup> *See, e.g.*, NCAT, NHTSA-2018-0067-11969.

<sup>3094</sup> API, Detailed Comments, EPA-HQ-OAR-2018-0283-5458.

<sup>3095</sup> MECA, Detailed Comments, NHTSA-2018-0067-11994.

& Equipment Manufacturers Association (MEMA) also supported a well-to-wheel fuel lifecycle approach, commenting that without this type of comprehensive assessment on the fuel impacts and comprehensive CO<sub>2</sub> costs, policies improperly “slant toward preferred technologies.”<sup>3096</sup> Nonetheless, MEMA commented that it is not opposed to continuing to allow 0 grams/mile emissions factor for electric powered vehicles through 2026.

The Union of Concerned Scientists (UCS) commented that not accounting for upstream emissions combined with the multipliers has a significant impact on the efficacy of the standard, and extending these regulatory incentives is more likely to result in a credit giveaway than to drive additional deployment of electric vehicles.<sup>3097</sup> UCS further commented that, to date, more than half of the electric vehicles sold have been in California and the states that have adopted California’s ZEV standards; however, UCS asserted, federal standards ignore the upstream emissions for all vehicles sold.

After carefully considering the wide range of comments on whether to include upstream emissions associated with electricity use in the compliance calculations for electrified vehicles, EPA has decided to allow the continued use of the 0 grams/mile emissions factor with no per-manufacturer production caps or other limitations. EPA is revising its regulations to remove the production caps and related provisions. When EPA initially adopted a production cap for manufacturers that use the 0 grams/mile emissions factor, in the rulemaking to establish CO<sub>2</sub> standards for MY 2012-2016 vehicles, there were no controls in place for CO<sub>2</sub> emissions from

---

<sup>3096</sup> MEMA, EPA-HQ-OAR-2018-0283-5692. See <https://www.mema.org/sites/default/files/resource/MEMA%20CAFE%20and%20GHG%20Vehicle%20Comments%20FINAL%20with%20Appendices%20Oct%2026%202018.pdf>.

<sup>3097</sup> UCS, Detailed Comments, NHTSA-2018-0067-12039.

electricity production.<sup>3098</sup> This was also the case when EPA extended the 0 grams/mile upstream provision and revised the production caps in the rule establishing MY 2017-2025 standards.<sup>3099</sup> However, since then, EPA has adopted a program to control CO<sub>2</sub> emissions from power plants.<sup>3100</sup> Emissions from the power sector have been declining and that trend is projected to continue.<sup>3101</sup> For these reasons, EPA no longer views the upstream emissions factor as an incentive in the same way it views a multiplier incentive which provides bonus credits. EPA agrees that, at this time, manufacturers should not account for upstream utility emissions. Therefore, EPA is adopting regulatory changes consistent with its historical practice of basing compliance with vehicle emissions standards on tailpipe emissions through model year 2026. EPA may choose to reconsider this decision in a future CO<sub>2</sub> rulemaking, and will reexamine the issue when establishing standards commencing with the 2027 model year<sup>3102</sup>.

Second, EPA requested comments on extending or increasing advanced technology incentives, including multiplier incentives, with multipliers in the range of 2.0-4.5. EPA received a wide range of comments both for and against increasing the multiplier incentives.

---

<sup>3098</sup> 75 FR 25341, May 7, 2010.

<sup>3099</sup> 77 FR 62816, October 15, 2012.

<sup>3100</sup> 84 FR 32520, July 8, 2019.

<sup>3101</sup> 84 FR 32561.

<sup>3102</sup> By comparison, the CAFE program uses an energy efficiency metric instead of an emissions metric, and standards that are expressed in miles per gallon. For PHEVs and BEVs, to determine gasoline the equivalent fuel economy for operation on electricity, a Petroleum Equivalency Factor (PEF) is applied to the measured electrical consumption. The PEF for electricity was established by the Department of Energy, as required by statute, and includes an accounting for upstream energy associated with the production and distribution for electricity relative to gasoline. Therefore, the CAFE program includes upstream accounting based on the metric that is consistent with the fuel economy metric. The PEF for electricity also includes an incentive that effectively counts only 15 percent of the electrical energy consumed.

The MY 2017-2025 CO<sub>2</sub> program finalized in 2012 included incentive multipliers for certain advanced technologies for MY 2017-2021 vehicles.

The Auto Alliance, Global Automakers, and several individual manufacturers commented in support of continued and increased multipliers. The Auto Alliance commented that EPA should extend and significantly expand multipliers “to encourage a transition to these technologies while cost, range, and infrastructure challenges are addressed to encourage ongoing investments in advanced technologies.”<sup>3103</sup> Global Automakers commented that multipliers should be included through MY 2026, set at values that encourage ongoing investment in advanced technologies, without diluting overall efficiency improvements in the program.<sup>3104</sup> NCAT, Eaton, Plug-in America, Alliance to Save Energy, SAFE, and MEMA also supported additional multiplier incentives to encourage further the production and sale of advanced technology vehicles.<sup>3105</sup>

EPA also received comments against extending the multiplier credits. UCS commented that reducing the stringency of the standards lessens the need for the adoption of these vehicles and undermines the initial rationale for these credits, resulting in a significant bank of credits which would further erode the benefits of these standards.<sup>3106</sup> American Council for an Energy-Efficient Economy (ACEEE) commented that providing multiplier incentives for any longer

---

<sup>3103</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

<sup>3104</sup> Global Automakers, Detailed Comments, NHTSA-2018-0067-12032.

<sup>3105</sup> NCAT, Detailed Comments, NHTSA-2018-0067-11969; Eaton, Detailed Comments, EPA-HQ-OAR-2018-0283-5068; Plug-In America, Detailed Comments, NHTSA-2018-0067-12028; Alliance to Save Energy, Detailed Comments, NHTSA-2018-0067-11837; SAFE, Detailed Comments, NHTSA-2018-0067-11981; *see* <https://www.mema.org/sites/default/files/resource/MEMA%20CAFE%20and%20GHG%20Vehicle%20Comments%20FINAL%20with%20Appendices%20Oct%2026%202018.pdf>.

<sup>3106</sup> UCS, Detailed Comments, NHTSA-2018-0067-12039.

period, or at a greater rate than those currently in place, would create windfall credits for manufacturers given the industry's current product plans.<sup>3107</sup> Fiat Chrysler commented generally in support of a multiplier incentive, but noted that since multipliers are a CO<sub>2</sub>-only flexibility not present in the CAFE program, greater use of multipliers would result in further disharmonizing the programs.<sup>3108</sup> API commented against multipliers, stating that the program should be technology neutral and that regulatory agencies should not incentivize either producer or consumer investments in government-selected technologies applied to government-selected vehicle categories.<sup>3109</sup>

In this final rule, EPA is neither adopting any additional EV or FCV multipliers nor extending the existing multipliers scheduled to phase out after MY 2021 for EVs, PHEVs, and FCVs. EPA is concerned that additional multiplier incentives beyond those already in place for these vehicles which are currently available to consumers would reduce the emissions benefits associated with the program. As discussed below in section IX.B.1.a.(3)(b), EPA is providing an additional multiplier for dedicated and dual-fuel NGVs, which are not currently produced by auto manufacturers, for MYs 2022-2026. The CO<sub>2</sub> program already provides a significant incentive for PHEVs, EVs, and FCVs by only counting tailpipe emissions (not accounting for upstream emissions).

(3) *Special Considerations*

(a) *Incentives for Connected or Automated Vehicles*

Connected and automated (including autonomous) vehicles have the potential to impact significantly vehicle emissions in the future, with their aggregate impact being either positive or negative, depending on a large number of vehicle-specific and system-wide factors. EPA noted in the proposal that connected or automated vehicles would be eligible for credits under the off-cycle program if a manufacturer provides data sufficient to demonstrate the real-world emissions benefits of such technology applied to its vehicles. However, demonstrating the incremental real-world benefits of these emerging technologies will be challenging. Prior to the proposal, stakeholders suggested that EPA should consider an incentive for these technologies without requiring individual manufacturers to demonstrate real-world emissions benefits of the technologies. A number of stakeholders also requested that EPA consider credits for automated and connected vehicles that are placed in ridesharing or other high mileage applications, where any potential environmental benefits could be multiplied due to the high utilization of these vehicles. EPA requested comment on such incentives as a way to facilitate increased use of these technologies, including some level of assurance that they will lead to future additional emissions reductions. For example, EPA stated in the proposal that any near-term incentive program should include some demonstration that the technologies will be both truly new and have some connection to overall environmental benefits. EPA further outlined and sought comment on several approaches to incentivize automated and connected vehicle technologies.

EPA received comments supporting and opposing incentives for automated and connected vehicles. The Auto Alliance commented that the agencies should incentivize the

adoption of these technologies and provide for possibly additional credit once the benefits beyond the credit values have been confirmed.<sup>3110</sup> It further commented that a growing body of modeling results, as well as real-world driving statistics, show that current automated driving technologies improve real-world fuel efficiency and reduce CO<sub>2</sub> emissions. SAFE commented that connected automated vehicles have tremendous potential to save lives, and when combined with ride-sharing and electric powertrains, they can also increase efficiencies and save fuel.<sup>3111</sup> SAFE argued that an initial review of the literature shows the potential for these technologies to improve fuel economy by up to 25 percent when they are optimized and aggregated alongside other traditional efficiency technologies. Toyota commented that automated vehicles, and possibly new mobility models such as ridesharing, can help attain societal goals concerning climate change, energy security, traffic congestion, and safety.<sup>3112</sup> Ford commented that it is supportive of credits for future connected and automated vehicles and that autonomous vehicles are considered the future of personal mobility, with many manufacturers announcing plans to release autonomous-capable vehicles in the near term.<sup>3113</sup> Ford added that these vehicles have the potential to not only provide meaningful real-world CO<sub>2</sub> and fuel economy benefits, but also add true societal benefit for the public good by providing transportation to those who would otherwise not have access. General Motors and Jaguar Land Rover commented in favor of additional credits for vehicles placed in ride-sharing or high mileage applications.<sup>3114</sup>

---

<sup>3110</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

<sup>3111</sup> SAFE, Detailed Comments, NHTSA-2018-0067-11981.

<sup>3112</sup> Toyota, Detailed Comments, NHTSA-2018-0067-12150.

<sup>3113</sup> Ford, Detailed Comments, NHTSA-2018-0067-11928.

<sup>3114</sup> General Motors, Detailed Comments, NHTSA-2018-0067-11858; Jaguar Land Rover, Detailed Comments, NHTSA-2018-0067-11916.

SAFE commented that autonomous vehicles will lead to new jobs and better worker productivity. It stated that these vehicles will also reduce congestion and lead to safer travel.<sup>3115</sup>

Other commenters opposed incentives for automated and connected vehicles, generally commenting that while the technologies are promising, the impacts of the technologies remain highly uncertain and therefore incentives are not appropriate. ACEEE commented that EPA should not incentivize technologies such as automated vehicle technology or ridesharing services, unless and until it can be demonstrated that such an incentive will result in emissions reduction benefits and will not undermine the existing standards.<sup>3116</sup> ACEEE believes that there currently exists no real-world data to justify granting of off-cycle credits for automated vehicle technologies, and that providing automakers credits for deploying technologies which are driven by demands other than fuel savings and emissions reduction only allows them to make fewer real-world emissions reductions elsewhere. ACEEE further stated that while automated vehicles promise all-new possibilities and efficiencies in transportation and the use of infrastructure, the net impact on transportation sector energy use and emissions is unknown.

UCS commented that the “evidence to-date does not warrant incentivizing such technologies—there is no provable environmental benefit of such technologies, and the agencies have previously correctly acknowledged that any such potential impacts would be related to indirect benefits, which raise serious concerns about compliance and enforcement to ensure the integrity of the program.”<sup>3117</sup> Honda commented that there remains considerable uncertainty in

---

<sup>3115</sup> SAFE, Detailed Comments, NHTSA-2018-0067-11981.

<sup>3116</sup> ACEEE, Detailed Comments, NHTSA-2018-0067-12122.

<sup>3117</sup> UCS, Detailed Comments, NHTSA-2018-0067-12039.

the literature regarding the energy and environmental benefits (or negative benefits) of connected/automated vehicle technology.<sup>3118</sup> Honda commented that if technology benefits can be verified under robust, repeatable conditions, they should warrant off-cycle credits under the existing off-cycle program. Honda does not believe credits should be granted for application of technology alone.

CARB commented that new compliance flexibilities (or off-cycle credit categories) for automated vehicles are not appropriate at this time.<sup>3119</sup> CARB believes that, although the technology is widely expected to provide safety and mobility benefits, automakers are expected to bring the technology to market regardless, so incentives are unnecessary, and it is not established that these technologies will reduce emissions given their potential for high annual mileage. Resources for the Future commented they do not see a rationale for providing special credits to automated vehicles since such vehicles could increase or decrease emissions.<sup>3120</sup> Competitive Enterprise Institute (CEI) commented that some connected and/or automated vehicle technology applications—namely platooning—may improve fuel efficiency through improved aerodynamics and thus reduce CO<sub>2</sub> emissions; however, such applications to date are limited to heavy-vehicle prototypes beyond the scope of this rulemaking and in any event should be subject to verification prior to any award of off-cycle credits.<sup>3121</sup> CEI commented further: “We urge EPA to preserve the existing off-cycle program requirement that manufacturers demonstrate CO<sub>2</sub> emissions reductions prior to the award of credits, rather than picking technology winners and losers that have nothing to do with fuel economy or emissions.”

---

<sup>3118</sup> Honda, Detailed Comments, NHTSA-2018-0067-11818.

<sup>3119</sup> CARB, Detailed Comments, NHTSA-2018-0067-11873.

<sup>3120</sup> Resources for the Future, Detailed Comments, NHTSA-2018-0067-11789.

<sup>3121</sup> CEI, Detailed Comments, EPA-HQ-OAR-2018-0283-4166.

National Association of Truck Stop Operators (NATSO) commented against incentives, stating that although automated vehicles have the potential positively to transform transportation (and indeed day-to-day life) in the U.S., there are also a number of complexities and potential costs associated with them.<sup>3122</sup>

EPA is not adopting new incentives for automated and connected vehicles. While EPA agrees there may be potential for such technologies to reduce emissions long-term, depending on how the technologies are developed, implemented, and used, EPA remains concerned about the high degree of uncertainty regarding the impacts of the technologies and potential loss of emissions reductions associated with such incentives. EPA agrees with the comments that, at this time, it is more appropriate for manufacturers to seek credits through the existing off-cycle credits program where manufacturers would be required to provide data demonstrating direct emissions improvements for the technologies.

*(b) Natural Gas Vehicle (NGV) Credits*

Vehicles that are able to run on compressed natural gas (CNG) are eligible for an advanced technology multiplier credit for MYs 2017-2021, as discussed in the Advanced Technology Incentives section above. Dual-fueled natural gas vehicles, which can run either on natural gas or on gasoline, also may use utility factors higher than 0.5 when weighting tailpipe emissions measured over the test procedures while operating on natural gas and gasoline test fuels if the vehicles meet minimum design criteria, including minimum CNG range requirements. Prior to the proposal, EPA received input from several industry stakeholders that

---

<sup>3122</sup> NATSO, Detailed Comments, EPA-HQ-OAR-2018-0283-5484.

supported expanding these incentives to stimulate production of vehicles capable of operating on natural gas, including treating incentives for natural gas vehicles on par with those for electric vehicles and other advanced technologies, and adjusting or removing the minimum range requirements for dual-fueled CNG vehicles. EPA requested comments on these potential additional incentives for natural gas fueled vehicles.

Among comments received regarding incentives for NGVs, Ariel Corporation and VNG together commented that NGVs can be effectively promoted by providing a level playing field and regulatory parity with EVs.<sup>3123</sup> They stated, “an effective alternative compliance pathway for NGVs can be established with a few simple changes to the regulations including applying the ‘0.15 divisor’ to emissions calculations, which would harmonize EPA’s regulations with the statutory CAFE program, and recognize the real-world emissions benefits of RNG [renewable natural gas], and provide NGVs with reasonable parity with EVs.” Ariel and VNG commented also that EPA should offer advanced technology production multipliers for NGVs on par with EVs and FCVs, with NGVs receiving these incentives at the same level and for the same duration as electric and fuel-cell vehicles. These commenters believe that while NGVs have lower technology hurdles than these vehicles, they face similar infrastructure challenges and offer similar or superior emissions benefits through the use of RNG.

Coalition for Renewable Natural Gas, NGVAmerica, the American Gas Association, and the American Public Gas Association commented in a joint submission that NHTSA and EPA should use this rulemaking opportunity to expand incentives for NGVs and thereby increase the

---

<sup>3123</sup> Joint Submission from Ariel Corp. and VNG.co, Detailed Comments, NHTSA-2018-0067-7573.

availability of NGVs in the light-duty sector, particularly for pickup trucks, work vans, and sport utility vehicles.<sup>3124</sup> These commenters also submitted comments supporting additional incentives for full-size pickup NGVs and incentives for vehicles equipped to be converted to operate on natural gas. Coalition for Renewable Natural Gas, et al., commented that allowing 0 grams/mile accounting for electricity use is favorable to electric vehicles because it allows electric vehicle manufacturers to take credit for anticipated improvements in emissions associated with the electric grid resulting from increased use of natural gas and renewable energy.<sup>3125</sup> It further commented that given the significant amount of renewable natural gas currently being used and projected to be used in future years, using a factor of 0.15 or even greater to offset NGV emissions is warranted because RNG use reduces carbon dioxide emissions by 85 percent or more in most cases. Ingevity similarly commented in support of EPA including a 0.15 multiplier incentive for purposes of CO<sub>2</sub> compliance parity between natural gas and electric dual-fuel vehicles as necessary and critical to promote the commercialization of light-duty natural gas vehicles and stimulate the increased utilization of RNG. Ingevity added that growth in the natural gas vehicle market is necessary to meet future RFS obligations.<sup>3126</sup>

United States Senator James M. Inhofe commented that “even if all current incentives for EVs are eliminated, EVs still have a compliance advantage going forward. This is because the policy and technical approaches underlying the [CO<sub>2</sub>] regulations embedded preferential treatment for the previous administration's favored technology. I respectfully ask you not to give

---

<sup>3124</sup> Joint Submission from the Coalition for Renewable Natural Gas, NGVAmerica, the American Gas Association, and the American Public Gas Association, Detailed Comments, NHTSA-2018-0067-11967.

<sup>3125</sup> Joint Submission from the Coalition for Renewable Natural Gas, NGVAmerica, the American Gas Association, and the American Public Gas Association, Detailed Comments, NHTSA-2018-0067-11967.

<sup>3126</sup> Ingevity, Detailed Comments, NHTSA-2018-0067-8666.

NGVs preferential treatment, but to level the playing field to allow the marketplace to determine the future of NGV adoption and not the federal bureaucracy. To achieve this parity, reinstating the 0.15 [CO<sub>2</sub>] multiplier is essential.”<sup>3127</sup>

In addition to supporting the application of a 0.15 factor, some in the natural gas industry also commented in support of production multipliers for NGVs. Ariel and VNG commented that EPA should offer advanced technology production multipliers for NGVs on par with EVs and FCVs, with NGVs receiving these incentives at the same level and for the same duration as electric and fuel cell vehicles. Ingevity commented that dual-fuel and dedicated NGV multipliers should be extended through 2025 as an effective way to promote the commercialization of these kinds of vehicles by the automakers. NGV America et al. commented that “NGVs, both dedicated and dual-fuel, should be provided with the same vehicle production multiplier credits as have previously been, and continue to be, provided to EVs and FCVs. Given that the expected and likely range capabilities of NGVs will generally exceed EV ranges (including natural gas dual-fuel vehicles that significantly outperform the range capabilities of PHEVs which justifiably enjoy a lower multiplier as compared to EVs), the vehicle production multipliers that are used for EVs should be applied to NGVs, including dual fuel NGVs. Specifically, dedicated and dual-fuel NGVs (or all covered advanced technology vehicles) should receive a base multiplier of 2.0 (or any such higher multiplier afforded to EVs/FCVs) for at least model years 2019 through 2021 and the same multipliers afforded to EVs/FCVs thereafter through 2025.”

---

<sup>3127</sup> James M. Inhofe, Detailed Comments, EPA-HQ-OAR-2018-0283-7456.

National Association of Convenience Stores (NACS) and the Society of Independent Gasoline Marketers of America (SIGMA) commented, “the Associations urge you to treat all fuels and technologies equally, including NGVs, EVs, and petroleum-based motor fuels. It is the role of the Agencies to set performance specifications via notice-and-comment rulemaking to ensure that they are appropriate. Once the specifications are set, however, it should be up to the market to determine how best to meet them.”<sup>3128</sup>

UCS commented that natural gas is a potent greenhouse gas, and any direct emissions of methane pose a significant threat to any effort to limit climate change.<sup>3129</sup> UCS stated, “these direct emissions upstream significantly undermine any potential benefit that could come from the pump-to-wheel benefits of displacing gasoline or diesel with natural gas.” UCS also commented, “furthermore, the technology underpinning any natural gas-powered vehicle is exceptionally mundane—natural gas has been deployed previously in vehicles like the Honda Civic, and aftermarket CNG conversions have long been available on the market. Again, there is no critical hurdle to overcome with CNG powered vehicles, and there is little if any benefit to any such incentives. We strongly recommend that EPA eliminate all incentives for natural gas vehicles and instead ensure such vehicles are credited commensurate with their impact on the environment.” CARB also commented that new compliance flexibilities for NGVs are not appropriate at this time.<sup>3130</sup>

---

<sup>3128</sup> Joint submission on behalf of NACS and SIGMA, Detailed Comments, EPA-HQ-OAR-2018-0283-5824.

<sup>3129</sup> UCS, Detailed Comments, NHTSA-2018-0067-12039.

<sup>3130</sup> CARB, Detailed Comments, NHTSA-2018-0067-11873.

The Natural Gas Vehicles of America (NGV America) commented that there is no incentive under existing EPA and NHTSA regulations for an automaker to sell vehicles equipped to be converted to operate on natural gas (so-called “gaseous-prep vehicles”), even though selling such vehicles often results in the increased availability of alternative fuel vehicles. Today, most alternative fuel conversions are performed on newly manufactured gaseous-prep vehicles or vehicles that have been equipped by the original equipment manufacturers with hardened valves, valve seats, pistons, and piston rings. As an example, most of Ford’s commercial truck line-up is available as gaseous-prep, and many such vehicles are converted to natural gas or propane by qualified vehicle manufacturers. Converting these vehicles, producing an assembly-line gaseous-prep vehicle, and sharing diagnostic information are critical to ensuring that aftermarket conversions perform well in-use and do not degrade the vehicle’s emission control equipment. Given the complexity of today’s automobiles, it is virtually impossible to legally convert new vehicles without this level of cooperation from vehicle manufacturers.

NGV America further commented that providing a regulatory incentive for automakers to sell these vehicles would expand the availability of gaseous-prep vehicles and increase consumer choice for alternative fuel vehicles. EPA, therefore, should provide a credit for selling such vehicles if the automaker can verify that the vehicles were subsequently upfitted or converted using an EPA certified alternative fuel system. Given the significant cost associated with certifying vehicles and installing natural gas tanks, there is very little likelihood that such an incentive would be abused by automakers. As with credits for original equipment manufactured vehicles, the utility factor for these vehicles would be based on the range of the vehicle when operating on natural gas. In this way, vehicles with larger range would earn more credit and vehicles with reduced range would earn less credit.

Regarding comments that EPA should provide additional credits to auto manufacturers for the potential use of RNG due to upstream benefits associated with the production of RNG by applying a 0.15 factor, EPA disagrees because auto manufacturers would not be required to ensure such fuels are used in the vehicles they produce over the life of those vehicles. Commenters provided a rationale for why they believe all NGVs produced in the future will be fueled with RNG, but EPA believes there is no assurance that this would be the case. If fossil fuel-based natural gas is used in the vehicles, the environmental benefits asserted by the commenters would not exist and the substantial vehicle incentives recommended by the commenters would result in a loss of environmental benefits. EPA does not believe it is appropriate to attribute most or all of the potential benefits of the production and use of RNG to the vehicle manufacturer. EPA's Renewable Fuel Standards (RFS) already appropriately credit RNG use as compared to fossil fuel-based natural gas. The RFS program provides a substantial incentive for RNG production, and those incentives may lead to even lower fuel pricing and greater demand for RNG as vehicle fuel, and for NGVs in the future. The RFS program also can provide incentives for liquid cellulosic fuels, advanced bio-diesel, and other types of renewable transportation fuels. Consistent with EPA's decision not to include upstream emissions associated with electricity use for EVs and PHEVs discussed above, EPA believes it is appropriate at this time to maintain the focus of the light-duty vehicle GHG standards on the capabilities of the vehicle to control emissions, and not rely on lifecycle fuel characteristics as a basis for developing specific vehicle incentives, particularly where those fuels are already incentivized by the RFS program.

After considering comments regarding incentive multipliers for NGVs and the current lack of light-duty NGV offerings by OEMs in the market, EPA has decided to include a

multiplier incentive of 2.0 for MY 2022-2026 dedicated and dual-fuel NGVs. This multiplier will go into effect when the previously established multipliers expire, thus extending the multiplier for NGVs for 5 years beyond those previously established for NGVs. While other alternative fuel vehicles that were provided multiplier incentives are increasingly available in the light-duty marketplace, no OEM is currently offering light-duty NGVs. Since Honda ended production of the CNG version of the Honda Civic at the end of MY 2015, there have been no OEM NGV offerings available to consumers. EPA continues to believe that NGVs could be an important part of the overall light-duty vehicle fleet mix, and such offerings would enhance the diversity of potentially cleaner alternative fueled vehicles available to consumers.<sup>3131</sup> EPA believes it is appropriate to extend the availability of a production multiplier through MY 2026 for both dual-fuel and dedicated NGVs to potentially help spur their re-introduction by OEMs in the light-duty vehicle market.

EPA also received comments on the application of the regulatory utility factor. For dual-fuel vehicles, emissions are measured on both fuels (e.g., gasoline and natural gas) and weighted using a factor referred to in the regulations as a utility factor. To use a utility factor for natural gas greater than 0.5, a dual-fuel NGV must meet design criteria requiring the vehicle to have a natural gas to gasoline driving range of 2:1. The vehicle must also preferentially operate on natural gas until the natural gas tank is empty. EPA adopted these design criteria as part of the 2012 final rule to help ensure vehicles using a utility factor of higher than 0.5 would likely be fueled with and use natural gas most of the time on the road. At that time, EPA was concerned that natural gas refueling may be much more inconvenient for drivers relative to electric charging

---

<sup>3131</sup> The CNG Honda Civic had approximately 20 percent lower CO<sub>2</sub> than the gasoline Civic in MY 2015.

for PHEVs due to a lack of CNG refueling stations (or home refueling, compared to the availability of home chargers for many PHEVs) and, therefore, dual-fuel vehicles with limited driving range on natural gas would likely frequently operate on gasoline.

EPA received comments regarding the design criteria. Ingevity commented that it has developed a low-pressure (900 psi) adsorbed natural gas (ANG) fuel storage technology that allows vehicles to be refueled using an affordable and reliable low-pressure natural gas fueling appliance.<sup>3132</sup> Ingevity commented that ANG will allow for a distributed refueling network at users' homes and businesses, just like electrical recharging equipment has been installed for PHEVs over the last several years. Ingevity commented that the design criteria for dual-fuel NGVs that were established in the MYs 2017-2025 final rule "make it impossible to reasonably and affordably manufacture a dual-fuel NGV that can fully utilize the utility factor (UF) approach for determining fuel economy and [CO<sub>2</sub>] emissions." Ingevity recommended that the design criteria for dual-fuel NGVs be removed and that the utility factor be based only on the range of the NGV on natural gas, equivalent to the treatment of PHEVs. MECA submitted similar comments regarding ANG technology.<sup>3133</sup>

Ariel and VNG also commented that design criteria imposed on dual-fuel NGVs add unnecessary costs and complexity, and currently are arbitrarily applied only to dual-fuel NGVs,

---

<sup>3132</sup> Ingevity, Detailed Comments, NHTSA-2018-0067-8666.

<sup>3133</sup> See MECA, Detailed Comments, NHTSA-2018-0067-11999.

and not to their dual-fuel hybrid counterparts.<sup>3134</sup> NACS, SIGMA, and NATSO also recommended that EPA remove eligibility requirements associated with the utility factor.<sup>3135</sup>

After considering the comments, EPA is removing the design criteria from the regulations and thereby allowing higher utility factors to be used for dual-fuel natural gas vehicles based solely on driving range on natural gas, as is the case for PHEVs. The utility factor represents a reasonable way of weighting the emissions of a dual-fuel vehicle on each fuel to derive a single emissions value when including the dual-fuel vehicles in a manufacturer's fleet average compliance determination. Ideally, the utility factor would match the use of each fuel in real-world vehicle operation. The utility factor is not meant to incentivize the adoption of a particular technology, so it differs fundamentally from incentives such as multipliers. With the development of low-pressure natural gas vehicle fueling system technology since the 2012 final rule, EPA's concerns regarding limited fueling infrastructure that led the agency to adopt the design criteria in the 2012 rule are significantly diminished. EPA believes that low-pressure fueling is a new advancement that offers the potential for more convenient refueling for individuals or businesses similar to that for PHEVs. EPA expects owners of dual-fuel CNG vehicles preferentially to seek to refuel and operate on CNG fuel as much as possible, both because the owner would have to pay a higher vehicle price for the dual-fuel capability, and because CNG fuel is considerably cheaper than gasoline. With the opportunity for relatively low-cost on-site refueling at homes or businesses, EPA expects such vehicles to be refueled with natural gas similar to how people refuel PHEVs. Vehicle purchasers that choose high pressure

---

<sup>3134</sup> Joint Submission from Ariel Corp. and VNG, Detailed Comments, NHTSA-2018-0067-7573.

<sup>3135</sup> Joint submission on behalf of NACS and SIGMA, Detailed Comments, EPA-HQ-OAR-2018-0283-5824; NATSO, Detailed Comment, EPA-HQ-OAR-2018-0283-5484.

vehicle systems over low pressure systems would likely do so only if they have ready access to a high pressure refueling system, for example, at a fleet's central fueling location. Removing the design criteria for dual-fuel natural gas vehicles also addresses the concerns of some commenters regarding the differing treatment of PHEVs and dual-fuel NGVs.

EPA believes that with the advancement of technology offering the potential for more flexible refueling of NGVs, removing the design criteria is a reasonable change to the regulations. This regulatory change will apply starting with MY 2021. MY 2021 will provide sufficient time for orderly implementation and EPA is not aware of any dual-fuel NGVs emissions certified for MYs 2019-2020 that would otherwise be affected if this change were to be implemented sooner.

EPA received comments that vehicle conversions and "gaseous-prep" vehicles should be eligible for credits. In response to comments on vehicle conversions, alternative fuel converters are not required to meet fleet average standards but instead may comply with 40 CFR part 85 subpart F regulations providing a tampering exemption. Fleet average standards are generally not appropriate for fuel conversion manufacturers because the "fleet" of vehicles to which a conversion system may be applied has already been accounted for under the OEM's fleet average standard. Alternative fuel converters are not manufacturing new vehicles, but are converting existing vehicles that have already been certified by the OEM. CO<sub>2</sub> credits are available to OEMs based on fleet emissions performance compared to the fleet average standards and therefore conversions are not eligible for these credits. EPA did not propose to change and is not changing the exemption process promulgated in 40 CFR part 85 subpart F. Because fuel conversions are not required to meet the fleet average standards, credits generated under those standards are not available. Regarding gaseous-prep vehicles, these vehicles are not NGVs at

initial sale and therefore are not eligible for NGV incentives. Instead, they are included in the OEM's fleet as gasoline-only vehicles. EPA disagrees with the commenters that such vehicles should be eligible for NGV incentives at time of initial sale if the vehicle is later converted to natural gas since the OEM does not measure the emissions of the vehicle on natural gas at time of certification and is not responsible for the emissions performance of the vehicle on natural gas over the life of the vehicle.

### C. NHTSA Compliance and Enforcement

#### 1. Overview of the NHTSA Compliance Process

Consumer choice drives the mixture of automobiles on the road. Manufacturers largely produce a mixture of vehicles to meet consumer demand and address compliance with CAFE standards through the application of fuel economy improving technologies to those vehicles, and by using compliance flexibilities and incentives that are available in the CAFE program. As discussed earlier in this notice, each vehicle manufacturer is subject to separate CAFE standards for passenger cars and light trucks, and for the passenger car standards, a manufacturer's domestically-manufactured and imported passenger car fleets are required to comply separately.<sup>3136</sup> Additionally, domestically-manufactured passenger cars are subject to a statutory minimum standard.<sup>3137</sup> CAFE program flexibilities are largely provided for in statute. Credits for air conditioning efficiency, off-cycle, and pickup truck advanced technologies are not

---

<sup>3136</sup> 49 U.S.C. 32904(b).

<sup>3137</sup> 49 U.S.C. 32902(b)(4).

expressly specified by CAFE statute, but are “implemented consistent with EPCA’s provisions regarding calculation of fuel economy” as discussed in section C.2 below.

Compliance with the CAFE program begins with manufacturers submitting required reports to NHTSA in advance and during the model year that contain information, specifications, data, and projections about their fleets.<sup>3138</sup> Manufacturers report early product projections to NHTSA describing their efforts to comply with CAFE standards per EPCA’s reporting requirements.<sup>3139</sup> Manufacturers’ early projections are required to identify any of the flexibilities and incentives manufacturers plan to use for air-conditioning (A/C) efficiency, off-cycle and, through MY 2021, full-size pickup truck advanced technologies. EPA consults with NHTSA when reviewing and considering manufacturers’ requests for fuel consumption improvement values for A/C and off-cycle technologies that improve fuel economy. NHTSA evaluates and monitors the performance of the industry using the information provided. NHTSA also audits manufacturers’ projected data for conformance and verifies vehicle design data through testing to ensure manufacturers are complying as projected. After the model year ends, manufacturers submit final reports to EPA, including final information on all the flexibilities and incentives allowed or approved for the given model year.<sup>3140</sup> EPA then calculates the fuel economy level of each fleet produced by each manufacturer, and transmits that information to NHTSA.<sup>3141</sup>

---

<sup>3138</sup> 49 U.S.C. 32907(a); 49 CFR 537.7.

<sup>3139</sup> 49 U.S.C. 32907(a).

<sup>3140</sup> For example, alternative fueled vehicles get special calculations under EPCA (49 U.S.C. 32905-06), and fuel economy levels can also be adjusted to reflect air conditioning efficiency and “off-cycle” improvements, as discussed below.

<sup>3141</sup> 49 U.S.C. 32904(c)-(e). EPCA granted EPA authority to establish fuel economy testing and calculation procedures; EPA uses a two-year early certification process to qualify manufacturers to start selling vehicles, coordinates manufacturer testing throughout the model year, and validates manufacturer-submitted final test results after the close of the model year.

NHTSA notes that some manufacturers have submitted and/or resubmitted requests for A/C and off-cycle benefits after EPA final reports are completed or nearly completed and, in those cases, such submissions are causing considerable delays in EPA's ability to finalize CAFE reports. Late and revised submissions can place significant burdens on the government in order to reassess a manufacturer's CAFE performances and standards and can also cause significant impacts on previous compliance model years. In the following sections, EPA and NHTSA are incorporating regulatory modifications or providing guidance to help manufacturers expedite approvals and to facilitate the governments processing of the flexibilities and incentives.

NHTSA determines each manufacturer's obligation to comply with applicable model year's CAFE standards and notifies the manufacturer if any of its fleet performances fall below standards. Manufacturers must submit plans detailing the compliance flexibilities to be used to resolve any possible noncompliances or may pay civil penalties to address any deficits for falling below standards. NHTSA periodically releases data and reports to the public through its CAFE Public Information Center (PIC) based on information in the EPA final reports for the given compliance model year, and based on the projections manufacturers provide to NHTSA for the next two model years.<sup>3142</sup>

## 2. NHTSA's CAFE Program Compliance

EPCA and EISA specify several flexibilities and incentives that are available to help manufacturers comply with CAFE standards. Some flexibilities are defined, and sometimes

---

<sup>3142</sup> NHTSA CAFE Public Information Center, [https://one.nhtsa.gov/cale\\_pic/CAFE\\_PIC\\_Home.htm](https://one.nhtsa.gov/cale_pic/CAFE_PIC_Home.htm).

limited by statute—for example, while Congress allowed manufacturers to transfer credits earned for over-compliance from their car fleet to their truck fleet and vice versa, Congress also limited the amount by which manufacturers could increase their CAFE levels using those transfers.<sup>3143</sup> Consistent with the limits Congress placed on certain statutory flexibilities and incentives, NHTSA crafted and implements the credit transfer and trading regulations authorized by EISA to help ensure that total fuel savings are preserved when manufacturers exercise statutory compliance flexibilities.

NHTSA and EPA have previously developed other compliance flexibilities and incentives for the CAFE program consistent with the statutory provisions regarding EPA’s calculation of manufacturers’ fuel economy levels. As discussed previously, NHTSA finalized in the 2012 final rule, for MYs 2017 and later, an approach for manufacturers’ “credits” under EPA’s program to be applied as fuel economy “adjustments” or “improvement values” under NHTSA’s program for: (1) technologies that cannot be measured or cannot be fully measured on the 2-cycle test procedure, i.e., “off-cycle” technologies; and (2) A/C efficiency improvements that also improve fuel economy but cannot be measured on the 2-cycle test procedure. Additionally, both agencies’ programs give manufacturers compliance incentives through MY 2021 for utilizing specified technologies on pickup trucks, such as pickup truck hybridization.

The following sections outline how NHTSA determines whether manufacturers are in compliance with the CAFE standards for each model year, and how manufacturers may use compliance flexibilities, or address noncompliance by paying civil penalties. As addressed

---

<sup>3143</sup> See 49 U.S.C. 32903(g).

above, some compliance flexibilities are expressly prescribed in statute and some are implemented consistent with EPCA's provisions regarding calculation of fuel economy. NHTSA proposed new language updating and clarifying existing regulatory text in this area as part of the NPRM. NHTSA also sought comments in the NPRM on these changes, as well as on the general efficacy of these flexibilities in the fuel economy and CO<sub>2</sub> programs.

Moreover, the following sections explain how manufacturers submit data and information to the agency. As part of the NPRM, NHTSA proposed to implement a new standardized template for manufacturers to use to submit CAFE data to the agency, as well as a standardized template for reporting credit transactions. Additionally, NHTSA proposed adding requirements that specify the precision of the fuel savings adjustment factor in 49 CFR 536.4. These new requirements are intended to streamline reporting and data collection from manufacturers, in addition to helping the agency use the best available data to inform CAFE program decision makers. The comments received to these proposals are included in Section IX.C.2.a)(2)(d) along with NHTSA's responses to the comments and final resolutions established in the final rule.

NHTSA also sought comments on removing or modifying certain CAFE program flexibilities. The comments received and NHTSA's responses to those comments are discussed below.

a) *How does NHTSA Determine Compliance?*

(1) *Manufacturers Submit Data to NHTSA and EPA and the Agencies Validate Results*

EPCA, as amended by EISA, requires a manufacturer to submit reports to the Secretary of Transportation explaining whether the manufacturer will comply with an applicable CAFE standard for the model year for which the report is made; the actions a manufacturer has taken or intends to take to comply with the standard; and other information the Secretary requires by regulation.<sup>3144</sup> A manufacturer must submit a report containing the above information during the 30-day period before the beginning of each model year, and during the 30-day period beginning the 180th day of the model year.<sup>3145</sup> When a manufacturer determines it is unlikely to comply with a CAFE standard, the manufacturer must report additional actions it intends to take to comply and include a statement about whether those actions are sufficient to ensure compliance.<sup>3146</sup>

To implement these reporting requirements, NHTSA issued 49 CFR Part 537, “Automotive Fuel Economy Reports,” which specifies three types of CAFE reports that manufacturers must submit. A manufacturer must first submit a pre-model year (PMY) report containing the manufacturer’s projected compliance information for that upcoming model year. By regulation, the PMY report must be submitted in December of the calendar year prior to the

---

<sup>3144</sup> 49 U.S.C. 32907(a).

<sup>3145</sup> *Id.*

<sup>3146</sup> *Id.*

corresponding model year.<sup>3147</sup> Manufacturers must then submit a mid-model year (MMY) report containing updated information from manufacturers based upon actual and projected information known midway through the model year. By regulation, the MMY report must be submitted by the end of July for the applicable model year.<sup>3148</sup> Finally, manufacturers must submit a supplementary report to supplement or correct previously submitted information, as specified in NHTSA's regulation.<sup>3149</sup>

If a manufacturer wishes to request confidential treatment for a CAFE report, it must submit both a confidential and redacted version of the report to NHTSA. CAFE reports submitted to NHTSA contain estimated sales production information, which may be protected as confidential until the termination of the production period for that model year.<sup>3150</sup> NHTSA temporarily protects each manufacturer's competitive sales production strategies, but does not permanently exclude sales production information from public disclosure. Sales production volumes are part of the information NHTSA routinely makes publicly available through the CAFE PIC.

The manufacturer reports provide information on light-duty automobiles such as projected and actual fuel economy standards, fuel economy performance values, and production volumes, as well as information on vehicle design features (e.g., engine displacement and transmission class) and other vehicle attribute characteristics (e.g., track width, wheelbase, and other off-road features for light trucks). Beginning with MY 2017, to obtain credit for fuel

---

<sup>3147</sup> 49 CFR 537.5(b).

<sup>3148</sup> *Id.*

<sup>3149</sup> 49 CFR 537.8.

<sup>3150</sup> 49 CFR part 512, appx. B(2).

economy improvement values attributable to additional technologies, manufacturers must also provide information regarding A/C systems with improved efficiency, off-cycle technologies (e.g., stop-start systems, high-efficiency lighting, active engine warm-up), and full-size pickup trucks with hybrid technologies or with emissions/fuel economy performance that is better than footprint-based targets by specified amounts. This includes identifying the makes and model types equipped with each technology, the compliance category those vehicles belong to, and the associated fuel economy improvement value for each technology.<sup>3151</sup> In some cases, NHTSA may require manufacturers to provide supplementary information to justify or explain the benefits of these technologies and their impact on fuel consumption or to evaluate the safety implication of the technologies. These details are necessary to facilitate NHTSA's technical analyses and to ensure the agency can perform enforcement audits as appropriate.

NHTSA uses manufacturer-submitted PMY, MMY, and supplementary reports to assist in auditing manufacturer compliance data and identifying potential compliance issues as early as possible. Additionally, as part of its footprint validation program, NHTSA conducts vehicle testing throughout the model year to confirm the accuracy of the track width and wheelbase measurements submitted in the reports.<sup>3152</sup> These tests help the agency better understand how manufacturers may adjust vehicle characteristics to change a vehicle's footprint measurement, and ultimately its fuel economy target. NHTSA also includes a summary of manufacturers'

---

<sup>3151</sup> NHTSA collects model type information based upon the EPA definition for "model type" in 40 CFR 600.002.

<sup>3152</sup> U.S. Department of Transportation, NHTSA, Laboratory Test Procedure for 49 CFR Part 537, Automobile Fuel Economy Attribute Measurements (Mar. 30, 2009), *available at* <http://www.nhtsa.gov/DOT/NHTSA/Vehicle%20Safety/Test%20Procedures/Associated%20Files/TP-537-01.pdf>.

PMY and MMY data in an annual fuel economy performance report made publicly available on its PIC.

NHTSA uses EPA-verified final-model year (FMY) data to evaluate manufacturers' compliance with CAFE program requirements, and draws conclusions about the performance of the industry. After manufacturers submit their FMY data, EPA verifies the information, accounting for NHTSA and EPA testing, and subsequently forwards the final verified data to NHTSA.

(2) *Changes to CAFE Reporting Requirements Made by This Final Rule*

NHTSA proposed changes to its CAFE reporting requirements with the intent of streamlining data collection and reporting for manufacturers while helping the agency obtain the best available data to inform CAFE program decision-makers. The agency developed two new standardized reporting templates for manufacturers and proposed to start using the templates beginning in the 2019 compliance model year. In the NPRM, NHTSA sought comments on the templates. NHTSA's responses to the comments received and the changes to the templates for the final rule are presented below.

(a) *Standardized CAFE Reporting Template*

When NHTSA received and reviewed manufacturers' projection reports for MYs 2013 – 2015, the agency observed that most did not conform to the requirements specified in 49 CFR Part 537. For example, NHTSA identified several instances where manufacturers' CAFE reports included a "yes" or "no" response to a request for a vehicle's *numerical* ground clearance values. In a 2015 notice of proposed rulemaking, NHTSA proposed to amend 49 CFR Part 537 to

require a new data format for manufacturers' light-duty vehicle CAFE projection reports.<sup>3153</sup> In response to the proposal, some manufacturers commented that the previous changes in reporting requirements generated confusion and led to reporting errors. NHTSA recognized that the modification to the base tire definition in the 2012 final rule for MYs 2017 and later seemed to make some manufacturers uncertain about what footprint data was required in the reports.<sup>3154</sup> Specifically, certain manufacturers did not understand that the modified base tire definition required them to provide estimated attribute-based target standards for each unique model type/footprint combination beginning with MY 2013. NHTSA discovered cases where manufacturers only provided target or vehicle data for certified vehicle configurations, and did not report information for each of the unique model type/footprint combinations for their available production vehicles in the market. However, NHTSA did not adopt the proposed data format from the 2015 proposed rule after receiving adverse comments from manufacturers.<sup>3155</sup>

Since the issuance of the final rule in 2016, NHTSA has continued to receive projection reports that contain inaccurate and/or missing data. These noncompliant reports impede NHTSA's ability to audit manufacturer compliance data, identify potential compliance issues, and analyze industry trends. Problems with inaccurate or missing data has become an even greater issue for manufacturers reporting on the new MY 2017 incentives for efficient A/C systems, off-cycle technologies, and full-size pickup trucks with hybrid technologies/improved exhaust emission performance.<sup>3156</sup> These incentives are explained in Section IX.C.2.c).

---

<sup>3153</sup> 80 FR 40540 (Jul. 13, 2015).

<sup>3154</sup> 49 CFR 523.2.

<sup>3155</sup> 81 FR 73958 (Oct. 25, 2016).

<sup>3156</sup> NHTSA allows manufacturers to use these flexibilities and incentives for complying with standards starting in MY 2017; the FCIV for full-size pickup trucks with hybrid technologies/improved exhaust emission performance applies only through MY 2021, as discussed further below.

Manufacturers seeking to take advantage of these new benefits must provide information at the model-type level; however, many manufacturers did not submit the required information in their PMY reports for MYs 2017, 2018, and 2019. This caused NHTSA's Office of Enforcement to send letters reminding manufacturers of their obligation to submit accurate and complete CAFE reports. NHTSA will continue to monitor the accuracy, completeness, and timeliness of manufacturers' CAFE reports and may take additional action as appropriate.

In the NPRM, NHTSA proposed a new standardized template for reporting PMY and MMY information, as specified in 49 CFR 537.7(b) and (c), as well as supplementary information required by 49 CFR 537.8. The template allows manufacturers to build out the required confidential versions of CAFE reports specified in 49 CFR Part 537 and to produce automatically the required non-confidential versions by clicking a button within the template. While NHTSA recognizes that modifications to the reporting requirements may initially be a slight inconvenience to manufacturers, the number of noncompliant reports the agency continues to receive justifies development of a uniform reporting method to help ensure compliance with CAFE regulations. Adopting a standardized template will assist manufacturers in providing the agency with all necessary data, thereby helping manufacturers to ensure they are complying with CAFE regulations. The template organizes the required data in a manner consistent with NHTSA and EPA regulations and simplifies the reporting process by incorporating standardized responses consistent with those provided to EPA. The template collects the relevant data, calculates intermediate and final values in accordance with EPA and NHTSA methodologies, and aggregates all the final values required by NHTSA regulations in a single summary worksheet. Thus, NHTSA believes that the standardized templates will benefit both the agency

and manufacturers by helping to avoid reporting errors, such as data omissions and miscalculations, and will ultimately simplify and streamline reporting.

NHTSA proposed to require that manufacturers use the standardized template for all PMY, MMY, and supplementary CAFE reports. NHTSA observed that a significant number of manufacturers submit their MMY reports as updated PMY reports—using the same amount of information, despite fewer data requirements. To conform with this method, NHTSA designed the template based on one standardized format that uses the same data requirements for all CAFE reports. This approach will further simplify CAFE projection reporting for manufacturers. The template contains a few additional data fields for certain vehicle characteristics; however, the inclusion of model type indexes will limit the number of required entries by populating a number of pre-entered data fields based on one value.

The standardized template will also allow NHTSA to modify its existing compliance database to accept and import uniform data and automatically aggregate manufacturers' data. This will allow NHTSA to execute its regulatory obligations more efficiently and effectively. Overall, the template will help to ensure compliance with data requirements under EPCA/EISA and drastically reduce the industry and government's burden for reporting in accordance with the Paperwork Reduction Act.<sup>3157</sup> NHTSA made the template available through its docket as well as its PIC, and sought comment on the regulatory changes to the reporting process.

Comments on the template were received from the Auto Alliance, Global Automakers, Ford, Mercedes-Benz, Toyota, Volvo and Volkswagen. The Auto Alliance, Toyota, and

---

<sup>3157</sup> 44 U.S.C. 3501 *et seq.*

Volkswagen opposed adopting the proposed template; however, Global Automakers agreed with the appropriateness of a standardized template that combines credit trading information with a data reporting template.<sup>3158</sup> Global Automakers also made two recommendations: (1) combine EPA's AB&T template with NHTSA's CAFE Projections Reporting Template to streamline reporting and reduce burden; and (2) add an FMY report requirement as an update to the MMY report submission.<sup>3159</sup>

Mercedes-Benz, Ford, and Volkswagen commented about data fields they believed were outdated, or not relevant to fuel economy testing or projecting fuel economy performance.<sup>3160</sup> Mercedes-Benz stated that some required data fields are not currently collected as a part of the fuel economy testing process, and their capture would require additional burden.<sup>3161</sup> Mercedes-Benz believes those data fields should be an optional requirement. Additionally, Mercedes-Benz recommended that NHTSA omit certain data fields, and stated that it would be helpful if NHTSA clarified its intention for the information in others.<sup>3162</sup> The specific data fields mentioned by Mercedes-Benz are in Table IX-6. Ford stated that many of the data fields are outdated, have no bearing on compliance assessments, and are misaligned with the current reporting structure, which is dictated by model type index.<sup>3163</sup> Similarly, Volkswagen stated that the proposed reporting template is populated with many fields that do not immediately appear relevant to

The Auto Alliance and Mercedes-Benz noted the differences in how NHTSA and EPA request data on A/C efficiency and off-cycle technologies. Mercedes-Benz highlighted the difficulty in predicting the projected sales production of the technologies, and the Auto Alliance cautioned that the number of reporting entries would increase by a factor of ten or more.<sup>3165</sup> The Auto Alliance stated its belief that the change in reporting requirements would cost its members more than \$1 million in information technology changes and that the changes could not be

<sup>3164</sup> Volkswagen, Detailed Comments, NHTSA-2017-0069-0583.

completed prior to MY 2021.<sup>3166</sup> Likewise, Ford contended that an implementation date for MY 2019 is aggressive and does not provide manufacturers with adequate lead time.<sup>3167</sup>

The Auto Alliance emphasized that the templates lack common reporting standardization with submissions to EPA.<sup>3168</sup> The Auto Alliance, Global Automakers, Toyota, and Volvo all requested that NHTSA and EPA accept a single, common reporting format to satisfy reporting for both agencies.<sup>3169</sup> Mercedes-Benz and Volkswagen requested stakeholder workshops to review the template with agency staff, with the former recommending that NHTSA host the workshops in partnership with EPA.<sup>3170</sup>

Ford requests that NHTSA re-examine the proposed required submission methods and reconsider current electronic submission methods.<sup>3171</sup> Ford expressed concern about the efficiency and security issues involved in submitting data on a CD through the mail containing confidential business information.<sup>3172</sup> Ford identified what it believes are better available avenues for submission, such as secured email or online portals like EPA's Central Data Exchange.<sup>3173</sup>

NHTSA disagrees with many of the manufacturers' assertions. Differences in EPA and NHTSA regulations prevent establishing a single reporting format for CAFE purposes. For

example, EPA only needs early model year information for manufacturers' applications for certification required under 40 CFR 86.1843-01. Manufacturers submit a single application with extensive details for each certified vehicle within a test group (i.e., the certified vehicle represents all the vehicles within the test group with similar technologies and performance characteristics). In comparison, NHTSA's required early model year information is far less detailed and is aggregated for model types and compliance categories. However, NHTSA and EPA already share all the relevant CAFE FMY information pursuant to an interagency agreement. This arrangement not only benefits manufacturers but also reduces the burden on the Federal government. Since much of the required data in NHTSA's projections template is already contained in EPA final reports, manufacturers would not be required to generate additional information but simply to provide estimates along the way to finalizing the data. NHTSA plans to release a data matrix that maps data elements between the CAFE template and the EPA final CAFE reports. NHTSA will notify the public when the matrix will be available on its website. Consequently, there is no need to create an additional final report as an updated version of NHTSA's MMY report, as suggested by Global Automakers. Once NHTSA configures its CAFE database to accept the reporting template via file upload, the agency will be able to use the model type index data field to connect data values from the template to corresponding values in EPA's final CAFE report. Manufacturers should note that CAFE reports are estimated projections of the EPA final CAFE compliance data. Contrary to Mercedes concerns about the difficulty in predicting the projected sales production of the technologies, NHTSA only expects manufacturers to provide the most up-to-date information available 30 days before a report is required to be submitted to the Administrator as specified in 49 CFR Part 537.5(d). While manufacturer PMY reports may be limited in certain instances (excluding

vehicles already in sales distribution), the MMY reports should be more inclusive and closer to the final values reported to EPA. Manufacturers should also be submitting supplementary reports to NHTSA if they believe there will be significant differences between CAFE MMY reports and the EPA final reports.

Commenters also stated that the A/C and off-cycle information reported in the NHTSA template is inconsistent with the EPA EV-CIS.<sup>3174</sup> NHTSA notes that the inconsistency between the agencies is intentional and necessary. NHTSA's off-cycle and A/C information must be collected in greater detail than that reported to the EPA EV-CIS. NHTSA collects detailed information on A/C and off-cycle technologies for determining penetration rates of specific technologies in the market, as well as analyzing the types of technologies as equipped on specific model types. In comparison, EPA aggregates the data for calculating credits, which allows for combining the benefits for all the technologies equipped on a model type. NHTSA also will use the detailed information for public disclosure and for auditing purposes. However, NHTSA acknowledges the Auto Alliance's concerns about the burden placed on the industry for providing more detailed data and therefore will not require manufacturers to start using the templates for reporting until MY 2023. NHTSA also agrees with Ford that it is important to consider the issues of security and efficiency with respect to the submission of confidential information to the agency, and the agency will consider possible changes to its procedures relating to the receipt and handling of confidential information to ensure streamlined, secure, and efficient submission of confidential information, including CAFE reports.<sup>3175</sup>

---

<sup>3174</sup> See, e.g., Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

<sup>3175</sup> See 49 CFR part 512, 537.5.

Secondly, NHTSA agrees with Mercedes-Benz and Volkswagen that workshops will aid in implementing the templates by providing instruction on how to complete them. NHTSA plans to host a workshop for manufacturers to discuss the implementation process. NHTSA believes finalizing the template in this rulemaking is important to address continuing concerns with reporting noncompliance (i.e., missing, incomplete, or inaccurate submissions) with the existing provisions in Part 537. Ultimately, establishing the new templates and holding educational workshops will be more effective in achieving industry compliance than imposing penalties on a case-by-case basis for failure to comply with reporting provisions.

Finally, NHTSA is also adopting changes to the proposed template in response to comments from Mercedes-Benz, Ford, and Volkswagen. NHTSA made changes to several of the data fields discussed by Mercedes-Benz. NHTSA does not agree with Mercedes-Benz's recommendation to omit the "Type of Overdrive" or "Type of Torque Converter" data fields; however, the agency does believe the proposed data to be inserted into those fields may be too specific for CAFE purposes. Therefore, the agency is finalizing a requirement that manufacturers identify whether vehicles are equipped with overdrive or a torque converter by selecting "Yes" or "No" from a dropdown list. The agency has also changed the "Calibration" field to "Other Calibration" to clarify the data being requested, and changed the "Auxiliary Emission Control Device" in the "Fuel Economy" worksheets to a dropdown that allows users to select multiple emission control systems. NHTSA believes that adding dropdown lists in the template creates uniformity in the reported information and makes the information more relevant to current vehicles.

The agency agrees with the essence of Volkswagen's assertion that some of the required data fields may no longer be as common on contemporary vehicles, and therefore, may not apply

to all manufacturers. As suggested by Mercedes-Benz, NHTSA has decided to make the “Catalyst Usage,” “Distributor Calibration,” “Choke Calibration,” and “Other Calibration” data fields optional with a default value of “N/A.” NHTSA does not agree with Mercedes-Benz’s recommendation that NHTSA provide a better understanding of its intention for the information in certain data fields. “Electric Traction Motor, Motor Controller,” “Battery Configuration,” “Electrical Charging System,” and “Energy Storage Device” are the data fields that characterize the basic powerplant for electric vehicles. Basic Engine, along with Carline and Transmission Class, make up a model type for light-duty vehicles. Therefore, those five fields are used to group vehicles by model type in accordance with EPA regulations. Fuel economy performance is calculated by Subconfiguration, which is a subset of a model type. As such, those five data fields are an integral part of grouping vehicles for fuel economy testing purposes in accordance with EPA regulations. NHTSA also does not agree with Volkswagen’s assertion that the template is populated with many fields that do not appear relevant to projecting CAFE performance. As previously mentioned, many of the data fields are used to arrange vehicles into groups for calculating fuel economy performance in accordance with 49 CFR 537.7.

Furthermore, NHTSA has re-engineered the template in a few areas to include additional supporting data elements used in calculating other data fields required by Part 537. These fields may not directly align with the existing requirements in Part 537 but are necessary for validation purposes. For this reason, NHTSA is also finalizing its proposal in the NPRM to remove the optional provisions for reporting the data fields for determining the CAFE model type target standards, making the information mandatory in the template. Additional changes have been made to the template to improve fuel economy calculations. NHTSA edited the template to include the calculation procedure for alternative-fuel vehicles and corrected the test procedure

adjustment (TPA) calculation to align the fleet average fuel economy calculation methodology with 40 CFR 600.510-12. Several expanded worksheets and functional features were also added to the template to improve the usability of the templates for manufacturers. These changes include modifications such as adding the estimated credits and a minimum domestic passenger shortfall calculator as the last fields to the “Summary” worksheet. Other functional changes include protecting users from changing the formatting or data validation in each cell and allowing columns to be widened by users.

(b) *Standardized Credit Documents*

A credit “[t]rade” is defined in 49 CFR 536.3 as “the receipt by NHTSA of an instruction from a credit holder to place its credits in the account of another credit holder.”<sup>3176</sup> “Traded credits are moved from one credit holder to the recipient credit holder within the same compliance category for which the credits were originally earned. If a credit has been traded to another credit holder and is subsequently traded back to the originating manufacturer, it will be deemed not to have been traded for compliance purposes.”<sup>3177</sup> NHTSA does not administer trade negotiations between manufacturers and when a trade document is received the agreement must be issued jointly by the current credit holder and the receiving party.<sup>3178</sup> NHTSA does not settle contractual or payment issues between trading manufacturers.

NHTSA created its CAFE database to maintain credit accounts for manufacturers and to track all credit transactions. A credit account consists of a balance of credits in each compliance

---

<sup>3176</sup> 49 CFR 536.3(b).

<sup>3177</sup> *Id.*

<sup>3178</sup> *See* 49 CFR 536.8(a).

category and vintage held by the holder. While maintaining accurate credit records is essential, it has become a challenging task for the agency given the recent increase in credit transactions. Manufacturers have requested that NHTSA approve trade or transfer requests not only in response to end-of-model year shortfalls, but also, during the model year, when purchasing credits to bank.

To reduce the burden on all parties, encourage compliance, and facilitate quicker NHTSA credit transaction approval, the agency proposed in the NPRM to add a required template to standardize the information parties submit to NHTSA in reporting a credit transaction. Presently, manufacturers are inconsistent in submitting the information required by 49 CFR 536.8, creating difficulty for NHTSA in processing transactions. The template NHTSA proposed is a simple spreadsheet that trading parties fill out. When completed, parties will be able to click a button on the spreadsheet to generate a credit transaction summary and if applicable credit trade confirmation, the latter of which shall be signed by both trading entities. The credit trade confirmation serves as an acknowledgement that the parties have agreed to trade credits. The completed credit trade summary and a PDF copy of the signed trade confirmation must be submitted to NHTSA. Using the template simplifies CAFE compliance aspects of the credit trading process, and helps to ensure that trading parties follow the requirements for a credit transaction in 49 CFR 536.8(a).<sup>3179</sup>

Additionally, the credit trade confirmation includes an acknowledgement of the “error or fraud” provisions in 49 CFR 536.8(f)-(g), and the finality provision of 49 CFR 536.8(g).

---

<sup>3179</sup> Submitting a properly completed template and accompanying transaction letter will satisfy the trading requirements in 49 CFR part 536.

NHTSA sought comment on this approach, as well as on any changes to the template that may be necessary to facilitate manufacturer credit transaction requests. The agency uploaded the proposed template to the NHTSA's docket and the CAFE PIC site for manufacturers to download and review.

Only Global Automakers commented on the proposed credit transaction template, and Global Automakers supported adopting a uniform template. Global Automakers stated that, in theory, it agrees that a standardized template with credit trading information is appropriate, and a similar template is already in use for these types of reporting requirements by its members that could be integrated into the end of the year EPA final report. Global Automakers believes the use of similar templates have been well-established, and such a template could be implemented across multiple agencies (i.e. NHTSA and EPA) with very little lag time in learning.<sup>3180</sup> No comments were received on the transaction letter generated by the template.

For the final rule, NHTSA is finalizing the proposed requirements for its credit templates to be incorporated into provisions for Part 536. NHTSA understands that manufacturers may be using similar credit reporting templates as part of their current business processes but has decided to adopt the template proposed in the NPRM. The NHTSA credit templates are an integral part of a long-range technology deployment that is already underway and will automate the NHTSA's CAFE database and web portal systems. When complete, the systems and portals will receive information directly from manufacturers and enable manufacturers, independently, to confirm credit trades and receive real-time credit balances. For this reason, diverging from the

---

<sup>3180</sup> Global Automakers, Detailed Comments, NHTSA-2018-0067-12032.

proposed templates for the final rule would impose unnecessary costs upon NHTSA. In the interest of accommodating the transition by manufacturers from other standardized templates, the agency will delay mandatory use of the CAFE credit template until January 1, 2021.

Manufacturers may deviate from the generated language in the NHTSA credit trade confirmation by adding additional qualifications but, at a minimum, must include the core information generated by the template.

*(c) Credit Transaction Information*

Credit trading among entities commenced in the CAFE program starting in MY 2011.<sup>3181</sup> To date, NHTSA has received numerous credit trades from manufacturers but has only made limited information publicly available.<sup>3182</sup> As discussed earlier, NHTSA maintains an online CAFE database with manufacturer and fleetwide compliance information that includes year-by-year accounting of credit balances for each credit holder. While NHTSA maintains this database, the agency's regulations currently state that it does not publish information on individual transactions, and NHTSA has not previously required trading entities to submit information regarding the compensation (whether financial, or other items of value) manufacturers receive in exchange for credits.<sup>3183, 3184</sup> Thus, NHTSA's PIC offers sparse information to those looking to determine the value of a credit.

---

<sup>3181</sup> 49 CFR 536.6(c).

<sup>3182</sup> Manufacturers may generate credits, but non-manufacturers may also hold or trade credits. Thus, the word "entities" is used to refer to those that may be a party to a credit transaction.

<sup>3183</sup> 49 CFR 536.5(e)(1).

<sup>3184</sup> NHTSA understands that not all credits are exchanged for monetary compensation. The proposal that NHTSA is adopting in this final rule requires entities to report compensation exchanged for credits, and is not limited to reporting monetary compensation.

The lack of information regarding credit transactions means entities wishing to trade credits have little, if any, information to determine the value of the credits they seek to buy or sell. It is widely assumed that the civil penalty for noncompliance with CAFE standards largely determines the upper value of a credit, because it is logical to assume that manufacturers would not purchase credits if it cost less to pay civil penalties instead, but it is unknown how other factors affect the value. For example, a credit nearing the end of its five-model-year lifespan would theoretically be worth less than a credit within its full five-model-year lifespan. In the latter case, the credit holder would likely value the credit more, as it can be used for compliance purposes for a longer period of time.

In the interest of facilitating a transparent and efficient credit trading market, NHTSA stated in the NPRM that consideration is being given to modifying its regulations for credit trade information. NHTSA sought comment in the NPRM about the feasibility of requiring more information disclosure around trades, including price information, noting that neither the public, shareholders, competitors, nor even the agencies themselves know the price of credit transactions. More specifically, NHTSA proposed requiring trading parties to submit information disclosing the identities of the parties to credit trades, the number of credits traded, and the amount of compensation exchanged for credits. Furthermore, NHTSA proposed that regulations would also permit the agency to publish information about specific transactions on the PIC.

NHTSA received comments from Volkswagen, Honda, Fiat Chrysler, Toyota, Global Automakers, the Auto Alliance, UCS, and from one private citizen, Mr. Jason Schwartz, regarding the scope of available credit information. All auto associations and manufacturers

requested that NHTSA maintain the confidentiality of credit trades and transactions. The remaining commenters felt increased transparency would benefit the market.

Global Automakers, the Auto Alliance, Fiat Chrysler, and Volkswagen stated that credit trades are business-to-business, contain internal information and can involve both financial and non-financial compensation between parties.<sup>3185</sup> They stated credit transactions should be viewed as being similar to other competitive purchase agreements, which include non-disclosure terms and strict confidentiality with regard to cost and compensation.<sup>3186</sup> They contended that negotiations must remain confidential to protect the sensitive business practices for both the buyer and seller, and that revealing purchasing terms could result in a competitive disadvantage for both.<sup>3187</sup> Further, it was stated that certain transactions may not happen if they are publicized for fear of public criticism, making the program less efficient.<sup>3188</sup>

Honda added that disclosing trading terms may not be as simple as a spot purchase at a given price.<sup>3189</sup> Honda explained that it has undertaken a number of transactions for both CAFE and CO<sub>2</sub> credits, and there has been a range of complexity in these transactions due to numerous factors that are reflective of the marketplace, such as the volume of credits, compliance category, credit expiration date, a seller's compliance strategy, and even the CAFE penalty rate in effect at that time.<sup>3190</sup> In addition, Honda stated that automakers have a range of partnerships and

<sup>3190</sup> Honda, Detailed Comments, NHTSA-2018-0067-11818.

cooperative agreements with their own competitors.<sup>3191</sup> Honda commented that credit transactions can be an offshoot of these broader relationships, and difficult to price separately and independently.<sup>3192</sup> Thus, Honda believes there may not be a reasonable, or even meaningful, presentation of “market” information in a transaction “price.”<sup>3193</sup> Finally, Honda concluded by stating that information on pricing terms and business partner pairings is highly competitive and, if made public, could divulge to competitors a buyer’s and/or seller’s future compliance strategy.<sup>3194</sup> For these reasons, Honda believes it is appropriate to maintain the confidentiality of trade terms, pricing information, and of trading partner identification.<sup>3195</sup>

Fiat Chrysler stated that revealing credit transaction information would reveal highly confidential business information.<sup>3196</sup> It stated that credit transaction information may reveal the technology that is most valued by a company and the value of putting certain technology into a vehicle.<sup>3197</sup> It believed that credit trades are complex business transactions made at arm’s length.<sup>3198</sup> As such, they may include monetary and non-monetary compensation, non-disclosure provisions, and other sensitive terms.<sup>3199</sup> Fiat Chrysler commented that publicizing such sensitive information could stifle the credit market and potentially result in uncompetitive outcomes, and could also decrease the efficiency in the credit trading marketplace.<sup>3200</sup> Fiat Chrysler further stated that the NPRM’s justifications for requiring the disclosure of credit

<sup>3200</sup> Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943.

transaction information is unfounded and the government has no need of this information in the regular course of doing business.<sup>3201</sup>

The Auto Alliance, Honda, Toyota, and Volkswagen argued against NHTSA publishing credit movements each model year on its PIC. They stated that detailed credit banks by account holder are available to the public or entities wishing to engage in the credit market and that information is already sufficient.<sup>3202</sup> Global Automakers further contended that the agencies know which companies are trading and how those credits are being used, which is all that should be required for administering the program.<sup>3203</sup> The Auto Alliance argued that in private markets, trades and prices often are not made public; this privacy does not mean that the markets operate any less effectively, nor that the public at large does not benefit from the transactions that lower costs for all parties.<sup>3204</sup>

Volkswagen further commented that revealing confidential purchase terms has no precedent in the automotive industry. Volkswagen's position is that it does not disclose contract pricing for purchasing fuel saving technologies from suppliers, such as for turbochargers or battery packs. Therefore, Volkswagen does not believe it is appropriate to disclose the purchase price for CAFE credits.<sup>3205</sup>

Opposite views from those expressed by automobile manufacturers were received in the comments from UCS and Jason Schwartz. Both commenters strongly supported an increase in information regarding credit trading in the CAFE program.<sup>3206</sup> They argued that more information will allow manufacturers to make better informed decisions and lead to greater industry efficiency in general.<sup>3207</sup> UCS added that while the PIC does have some information, it is difficult to discern how the manufacturers are dividing credits to offset shortfalls.<sup>3208</sup> It requested NHTSA disclose at least as much information as EPA provides from its program, if not providing more information on transaction price and compliance category.<sup>3209</sup> Jason Schwartz had similar arguments for more transparency. Mr. Schwartz added that the agencies can assume that credits may be traded at prices similar to the civil penalty rate for noncompliance under the CAFE standards, but not knowing the actual prices greatly complicates the agencies' estimations of the costs of complying with the standards.<sup>3210</sup> Schwartz used several examples to explain and justify the need for making data on credit transactions, prices, and holdings publicly available to help the agency and the public assess the efficacy of the program.<sup>3211</sup> He also explained that such information will enable the smooth operation of the credit market by enabling credit buyers to better evaluate the value of credits and placing all players on equal informational footing which facilitates price discovery, and assists buyers and sellers in reaching terms.<sup>3212</sup> He added that regulators should require greater transparency to

<sup>3212</sup> Jason Schwartz, Detailed Comments, NHTSA-2018-0067-12162.

facilitate oversight.<sup>3213</sup> He asserted his belief that greater transparency in tracking transactions and credits helps regulators detect fraud, manipulation, market power, abuse, and to enforce compliance.<sup>3214</sup>

In response to these comments, NHTSA has decided not to share detailed information on credit transactions or the cost of individual credit transactions with the public. NHTSA agrees with manufacturers that revealing confidential purchase terms could result in a competitive disadvantage for both credit buyers and sellers, as well as harm to companies revealing highly confidential business materials. However, NHTSA believes that greater government oversight is needed over the CAFE credit market. NHTSA needs to understand more information surrounding trades, including costing information. As Honda recognized in its comments, NHTSA needs to understand the full range of complexity in transactions, monetary and non-monetary, in addition to the range of partnerships and cooperative agreements between credit account holders—which may impact the price of credit trades.<sup>3215</sup> NHTSA also believes, as mentioned by commenters, that disclosure of information concerning credit trades is important for facilitating government oversight for protecting against fraud, manipulation, market power, and abuse which may occur in the credit market.

NHTSA is adopting new reporting provisions in this final rule. Starting January 1, 2021, manufacturers will be required to submit all credit trade contracts, including costing and transactional information, to the agency. This information may be submitted confidentially, in

accordance with 49 CFR part 512.<sup>3216</sup> NHTSA will use this information to determine the true cost of compliance for all manufacturers. This information will allow NHTSA to assess better the impact of its regulations on the industry, and provide more insightful information to use in developing future rulemakings. This confidential information will be held by secure electronic means in NHTSA's database systems. As for public information, NHTSA will include more information on the PIC on aggregated credit transactions, such as the combined flexibilities all manufacturers used for compliance as shown in Figure IX-6, or information comparable to the credit information EPA makes available to the public. In the future, NHTSA will consider what information, if any, can be meaningfully shared with the public on credit transactional details or costs, while accounting for the concerns raised by the automotive industry.

*(d) Precision of the CAFE Credit Adjustment Factor*

EPCA, as amended by EISA, required the Secretary of Transportation to establish an adjustment factor to ensure total oil savings are preserved when manufacturers trade credits.<sup>3217</sup> The adjustment factor applies to credits traded between manufacturers and to credits transferred across a manufacturer's compliance fleets.

In establishing the adjustment factor, NHTSA did not specify the exact precision of the output of the equation in 49 CFR 536.4(b). NHTSA's standard practice has been round to the nearest four decimal places (e.g., 0.0001) for the adjustment factor. However, in the absence of a regulatory requirement, many manufacturers have contacted NHTSA for guidance, and NHTSA

---

<sup>3216</sup> See also 49 U.S.C. 32910(c).

<sup>3217</sup> 49 U.S.C. 32903(f)(1).

has had to correct several credit transaction requests. In some instances, manufacturers have had to revise signed credit trade documents and submit additional trade agreements to properly address credit shortfalls.

NHTSA proposed in the NPRM to add requirements to 49 CFR 536.4 specifying the precision of the adjustment factor by rounding to four decimal places (e.g., 0.0001). NHTSA has also included equations for the adjustment factor in its proposed credit transaction report template, mentioned above, with the same level of precision. NHTSA sought comment on this approach but received no comments, and therefore is finalizing this approach in this final rule.

*(3) NHTSA then Analyzes EPA-Certified CAFE Values for Compliance*

After manufacturers complete certification testing and submit their final compliance values to EPA, EPA verifies the data and issues final CAFE reports to manufacturers and NHTSA. NHTSA then evaluates whether the manufacturers' compliance categories (i.e., domestic passenger car, imported passenger car, and light truck fleets) meet the applicable CAFE standards. NHTSA uses EPA-verified data to compare fleet average standards with actual fleet performance values in each compliance category. Each vehicle a manufacturer produces has a fuel economy target based on its footprint (footprint curves are discussed above in Section II.C), and each compliance category has a CAFE standard measured in miles per gallon (mpg). The manufacturer's fleet average CAFE standard is calculated based on the fuel economy target value and production volume of each vehicle model. The CAFE performance is calculated based on the compliance value and production volume of each vehicle model. A manufacturer complies with the CAFE standard if its fleet average performance is greater than or equal to its

required standard, or if it is able to use available compliance flexibilities, described below in Section IX.C.2.c. to resolve any shortfall.

If the average fuel economy level of the vehicles in a compliance category falls below the applicable fuel economy standard, NHTSA provides written notification to the manufacturer that it has not met that standard. The manufacturer is then required to confirm the shortfall and either submit a plan indicating how it will allocate existing credits, or if it does not have sufficient credits available in that fleet, how it will earn, transfer, and/or acquire credits, or pay the appropriate civil penalty. The manufacturer must submit a credit allocation plan or payment within 60 days of receiving agency notification.

NHTSA approves a credit allocation plan unless it finds the proposed credits are unavailable or that it is unlikely that the plan will result in the manufacturer earning sufficient credits to offset the projected shortfall. If a plan is approved, NHTSA revises the manufacturer's credit account accordingly. If a plan is rejected, NHTSA notifies the manufacturer and requests a revised plan or payment of the appropriate civil penalty. Similarly, if the manufacturer is delinquent in submitting a response within 60 days, NHTSA takes action to collect a civil penalty. If NHTSA receives and approves a manufacturer's plan to carryback future earned credits within the following three years in order to comply with current regulatory obligations, NHTSA will defer levying civil penalties for noncompliance until the date(s) when the manufacturer's approved plan indicates that the credits will be earned or acquired to achieve

compliance. If the manufacturer fails to acquire or earn sufficient credits by the plan dates, NHTSA will initiate noncompliance proceedings to collect civil penalties.<sup>3218</sup>

(4) *Civil Penalties for Noncompliance*

In the event that a manufacturer does not comply with a CAFE standard, EPCA provides that the manufacturer is potentially liable for a civil penalty.<sup>3219</sup> The manufacturer determines whether to use available credits to reduce or offset its potential penalty.<sup>3220</sup> This penalty rate is \$5.50 for each tenth of a mpg that a manufacturer's average fuel economy falls short of the standard for a given model year multiplied by the total volume of those vehicles in the affected compliance category manufactured for that model year.<sup>3221</sup> A person (or manufacturer) that violates 49 U.S.C. 32911(a), including general CAFE violations other than those for failing to comply with CAFE standards (i.e., fuel economy labeling violations), is also liable to the United States Government for a civil penalty of not more than \$42,530 for each violation. A separate violation occurs for each day the violation continues. All penalties are paid to the U.S. Treasury and not to NHTSA.<sup>3222</sup>

---

<sup>3218</sup> See generally 49 CFR part 536.

<sup>3219</sup> 49 U.S.C. 32911-12.

<sup>3220</sup> See 49 U.S.C. 32912.

<sup>3221</sup> NHTSA finalized a retaining the \$5.50 civil penalty rate in an April 2018 NPRM. See 83 FR 13904 (Apr. 2, 2018).

<sup>3222</sup> 49 USC 32912(e) allows for fiscal year 2008 and each fiscal year thereafter, the total amount deposited in the general fund of the Treasury during the preceding fiscal year from fines, penalties, and other funds obtained through enforcement actions conducted pursuant to EISA and EPCA (including funds obtained under consent decrees), the Secretary of the Treasury, subject to the availability of appropriations, shall: (1) transfer 50 percent of such total amount to the account providing appropriations to the Secretary of Transportation for the administration of this chapter, which shall be used by the Secretary to support rulemaking under this chapter; and (2) transfer 50 percent of such total amount to the account providing appropriations to the Secretary of Transportation for the administration of this chapter, which shall be used by the Secretary to carry out a program to make grants to manufacturers for retooling, reequipping, or expanding existing manufacturing facilities in the United States to produce advanced technology vehicles and components.

*Potential Civil Penalty*

$$= \$5.50 \times (\text{Avg. FE Performance} - \text{Avg. FE Standard}) \times 10 \\ \times \text{Total Production}$$

Since the inception of the CAFE program, the U.S. Treasury has collected a total of \$1,049,355,116 in CAFE civil penalty payments. Generally, import manufacturers have paid significantly more in civil penalties than domestic manufacturers, with the majority of payments made by import manufacturers for passenger cars and not light trucks. Over the total program lifetime, import manufacturers paid a total of \$1,048,896,676 in CAFE penalties while domestic manufacturers paid a total of \$458,440.<sup>3223</sup>

Prior to the CAFE credit trade and transfer program, several manufacturers opted to pay civil penalties instead of complying with CAFE standards. Since NHTSA introduced trading and transferring, manufacturers have largely traded or transferred credits to achieve compliance, rather than paying civil penalties for noncompliance. NHTSA therefore assumes that buying and selling credits is a more cost-effective strategy for manufacturers than paying civil penalties, in part, because it seems logical that the price of a credit is directly related to the civil penalty rate and decreases as a credit's life diminishes.<sup>3224</sup> Prior to trading and transferring, on average, manufacturers paid \$28,073,281.93 in civil penalty payments annually (a total of \$814,125,176 from MYs 1982 to 2010). Since trading and transferring began, manufacturers now pay an average of \$26,136,660 each model year. The agency notes that six manufacturers have paid civil penalties since 2011 totaling \$235,229,940; Fiat Chrysler paid a civil penalty in MY 2016 equal to \$77,268,720.50 and in MY 2017 equal to \$79,376,643.50 for failing to meet the

---

<sup>3223</sup> These totals include penalties associated with all fleets for these manufacturers. For example, the total penalties paid by import manufacturers includes penalties associated with shortfalls in those manufacturers' domestic passenger car fleets.

<sup>3224</sup> See 49 CFR 536.4 for NHTSA's regulations regarding CAFE credits.

minimum domestic passenger car standards for those MYs. NHTSA expects that, over the next several years, manufacturers will face challenges in avoiding paying further civil penalties as standards increase in stringency. Compared to the current \$5.50 CAFE civil penalty rate, a rate of \$14 would cause manufacturers that do not comply with CAFE to pay significantly higher civil penalties, potentially in the magnitude of hundreds of millions of dollars annually beyond current projections. Additionally, although NHTSA has not historically been privy to the monetary terms of credit trades, NHTSA expects that the price of credits would increase in line with any increase in the CAFE civil penalty rate.

*b) What Exemptions and Exclusions does NHTSA Allow?*

*(1) Emergency and Law Enforcement Vehicles*

Under EPCA, manufacturers are allowed to exclude emergency vehicles, which include law enforcement vehicles, from their CAFE fleet.<sup>3225</sup> All manufacturers that produce emergency vehicles have historically done so. NHTSA did not propose any changes to this exclusion and therefore is retaining the provision without change for the final rule.

*(2) Small Volume Manufacturers*

Per 49 U.S.C. 32902(d), NHTSA established requirements for exempted small volume manufacturers in 49 CFR part 525, “Exemptions from Average Fuel Economy Standards.” The small volume manufacturer exemption is available for any manufacturer whose projected or actual combined sales (whether in the U.S. or not) are fewer than 10,000 passenger automobiles

---

<sup>3225</sup> 49 U.S.C. 32902(e).

in the model year two years before the model year for which the manufacturer seeks an exemption.<sup>3226</sup> The manufacturer must submit a petition with information stating that the applicable CAFE standard is more stringent than the maximum feasible average fuel economy level that the manufacturer can achieve.<sup>3227</sup> NHTSA must then issue by *Federal Register* notice, a proposed decision granting or denying the petition and inviting public comment.<sup>3228</sup> If the agency proposed to grant the petition, the notice includes an alternative average fuel economy standard for the passenger automobiles manufactured by the manufacturer.<sup>3229</sup> After conclusion of the public comment period, the agency publishes a final decision in the *Federal Register*.<sup>3230</sup> If the agency grants the petition, it establishes an alternative standard, which is the maximum feasible average fuel economy level for the manufacturers to which the alternative standard applies.<sup>3231</sup> NHTSA did not propose and is not making any changes to the small volume manufacturer provision or alternative standards regulations in this rulemaking.

*c) What Compliance Flexibilities and Incentives are Currently Available Under the CAFE Program and How do Manufacturers Use Them?*

There are several compliance flexibilities and incentives that manufacturers can use to achieve compliance with CAFE standards beyond applying fuel economy-improving technologies. Some compliance flexibilities and incentives are statutorily mandated by Congress

---

<sup>3226</sup> 49 CFR 525.5.

<sup>3227</sup> 49 CFR 525.7(h).

<sup>3228</sup> 49 CFR 525.8(c).

<sup>3229</sup> *Id.*

<sup>3230</sup> 49 CFR 525.8(e).

<sup>3231</sup> 49 U.S.C. 32902(d)(2); 49 CFR 525.8(e).

through EPCA and EISA. These specifically include program credits generated from overcompliance, including the ability to carry-forward, carryback, trade and transfer credits, and special fuel economy calculations for dual- and alternative-fueled vehicles (discussed in turn, below). However, 49 U.S.C. 32902(h) expressly prohibits NHTSA from considering the availability of statutorily established credits (either for building dual- or alternative-fueled vehicles or from accumulated transfers or traders) in setting the level of the standards. Thus, NHTSA may not raise CAFE standards because manufacturers have enough credits to meet higher standards, or because alternative fuel vehicles (including electric vehicles) are available to help manufacturers achieve compliance. This is an important difference from EPA's authority under the CAA, which does not contain such a restriction, and which flexibility EPA has utilized in the past in determining appropriate levels of stringency for its program.

Generating, trading, transferring, and applying CAFE credits is governed by statute.<sup>3232</sup> Program credits are generated when a vehicle manufacturer's fleet over-complies with its standard for a given model year, meaning its vehicle fleet achieved a higher corporate average fuel economy value than the amount required by the CAFE program for that fleet in that model year. Conversely, if the fleet average CAFE level does not meet the standard, the fleet would incur debits (also referred to as a shortfall). A manufacturer whose fleet generates a credit shortfall in a given model year can resolve its shortfall using any one or combination of several credits flexibilities, including credit carryback, credit carry-forward, credit transfers, and credit trades.

---

<sup>3232</sup> 49 U.S.C. 32903.

NHTSA also has promulgated compliance flexibilities and incentives consistent with EPCA’s provisions regarding calculation of fuel economy levels for individual vehicles and for fleets.<sup>3233</sup> These compliance flexibilities and incentives, which were first adopted in the 2012 rule for MYs 2017 and later, include A/C efficiency improvement and off-cycle adjustments, and adjustments for advanced technologies in full-size pickup trucks, including adjustments for mild and strong hybrid electric full-size pickup trucks and performance-based incentives in full-size pickup trucks. The fuel consumption improvement benefits of these technologies measured by various testing methods can be used by manufacturers to increase the CAFE performance of their fleets. As discussed below, the adjustments for advanced technologies in full-size pickup trucks will no longer be available beginning in MY 2022.

Under NHTSA regulations, credit holders (including, but not limited to manufacturers) have credit accounts with NHTSA where they can, as outlined above, hold credits, and use them to achieve compliance with CAFE standards, by carrying forward, carrying back, or transferring credits across compliance categories. Manufacturers with excess credits in their accounts can also trade credits to other manufacturers, who may use those credits to resolve a shortfall currently or in a future model year. A credit may also be cancelled before its expiration date if the credit holder so chooses. Traded and transferred credits are subject to an “adjustment factor” to ensure total oil savings are preserved.<sup>3234</sup> Credits earned before MY 2011 may not be traded or transferred.<sup>3235</sup>

---

<sup>3233</sup> 49 U.S.C. 32904.

<sup>3234</sup> 49 CFR 536.4(c).

<sup>3235</sup> 49 CFR 536.6(c).

Credit “carryback” means that manufacturers are able to use credits to offset a deficit that had accrued in a prior model year, while credit “carry-forward” means that manufacturers can bank credits and use them towards compliance in future model years. EPCA, as amended by EISA allows manufacturers to carryback credits for up to three model years, and to carry-forward credits for up to five model years.<sup>3236</sup> Credits expire the model year after which the credits may no longer be used to achieve compliance with fuel economy regulations.<sup>3237</sup> Manufacturers seeking to use carryback credits must have an approved carryback plan from NHTSA demonstrating their ability to earn sufficient credits in future MYs that can be carried back to resolve the current MY’s credit shortfall. .

Credit “trading” refers to the ability of manufacturers or persons to sell credits to, or purchase credits from, one another. EISA gave NHTSA discretion to establish by regulation a CAFE credit trading program, to allow credits to be traded between vehicle manufacturers, now codified at 49 CFR part 536.<sup>3238</sup> EISA prohibited manufacturers from using traded credits to meet the minimum domestic passenger car CAFE standard.<sup>3239</sup>

As mentioned previously, the agencies sought comments in the NPRM on whether and how each agency’s existing flexibilities and incentives might be amended, revised, or deleted to avoid the inefficiencies and market distortions as discussed earlier. NHTSA was concerned with the potential for unintended consequences. Specifically, comments were sought on the appropriate level of compliance flexibilities, including credit trading, in a program that is

---

<sup>3236</sup> 49 U.S.C. 32903(a).

<sup>3237</sup> 49 CFR 536.3(b).

<sup>3238</sup> 49 U.S.C. 32903(f).

<sup>3239</sup> 49 U.S.C. 32903(f)(2).

correctly designed to follow statutory direction to create maximum feasible fuel economy standards. Given that the credit trading program is discretionary under EISA, NHTSA also sought comments on whether the credit trading provisions in 49 CFR part 536 should cease to apply beginning in MY 2022. Comments were sought on whether to allow all incentive-based adjustments, except those that are mandated by statute, to expire, in addition to other possible simplifications to reduce market distortion, improve program transparency and accountability, and improve overall performance of the compliance programs.

The comments received from the public and NHTSA's responses to those comments are discussed below. A summary of all the flexibilities and incentives, and information on whether they were either retained or modified for the final rule, is presented in Table IX-1 through Table IX-4.

*(1) Credit Carry-Forward and Back*

Under the CAFE program, when the average fuel economy of a compliance fleet manufactured in a particular model year exceeds its applicable average fuel economy standard, the manufacturer earns credits.<sup>3240</sup> The credits may be applied to: (1) any of the 3 consecutive model years immediately before the model year for which the credits are earned; and (2) any of the 5 consecutive model years immediately after the model year for which the credits are earned. For example, a credit earned for exceeding model year 2017 standards will be usable for compliance purposes through and including the 2022 compliance model year. NHTSA did not seek comment on or propose changes to any of the aspects of its lifespan for CAFE credits

---

<sup>3240</sup> 49 U.S.C. 32903 and 49 CFR 536.

because of the existing statutory limitation set forth by Congress. The public offered no comments on such flexibilities under the CAFE program.

(2) *Credit Trading*

All commenters responding to the NPRM on this issue favored retaining the existing CAFE credit trading program. Comments on credit trading were received from Volkswagen, Honda, General Motors, CARB, BorgWarner, Jaguar Land Rover, Fiat Chrysler, Global Automakers, the Auto Alliance, the Institute for Policy Integrity, Toyota, and academic commenters, Jeremy Michalek and Jason Schwartz. No comments were received supporting the idea of changing the existing credit trading program.

In general, manufacturers' comments centered around problems in predicting whether consumers will purchase the fuel efficient vehicles necessary for manufacturers to meet their compliance obligations. They stated that continuing the credit trading program allows manufacturers to address uncertainty in the market better.<sup>3241</sup> The Auto Alliance, Volkswagen, Fiat Chrysler, and Honda commented that credit flexibilities allow manufacturers to comply with the program even when faced with market uncertainties.<sup>3242</sup> Honda stated that credit trading allows the government to set reasonable standards without fear of having to cater to the least-capable manufacturer.<sup>3243</sup> Jaguar Land Rover stated the removal of NHTSA's credit trading

---

<sup>3241</sup> See, e.g., Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943.

<sup>3243</sup> Honda, Detailed Comments, NHTSA-2018-0067-11818.

programs would increase and intensify the dis-harmonization between the CO<sub>2</sub> and CAFE programs.<sup>3244</sup>

Global Automakers, Fiat Chrysler, Jason Schwartz, and Jeremy Michalek each commented that the credit trading program allows for a more efficient compliance process given that more fuel-efficient manufacturers can sell their credits to manufacturers who fall short.<sup>3245</sup> These commenters and BorgWarner stated that the program lowers the overall cost of reducing fuel consumption.<sup>3246</sup> Likewise, Jaguar Land Rover, Fiat Chrysler, and General Motors argued compliance flexibilities, like trading, increase the ability to achieve higher fuel economy and reduced CO<sub>2</sub> emissions. They found that the credit trading flexibility allows them to invest more money in technologies that will lead to future increases in their fuel economy.<sup>3247</sup> Similarly, CARB argued credit flexibilities have been shown to be successful in reducing emissions and spurring innovation. It saw no reason to remove a successful program.<sup>3248</sup>

Fiat Chrysler stated that credit trading allows manufacturers to provide more choices for consumers since manufacturers are not required to meet the standard exactly, but rather, they can purchase traded credits and then provide vehicles the public is demanding while still complying with fleet average standards.<sup>3249</sup> They stated that this leads to the overall compliance of the U.S.

<sup>3247</sup> Jaguar Land Rover, Detailed Comments, NHTSA-2018-0067-11916; Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943; General Motors, Detailed Comments, NHTSA-2018-0067-11858.

<sup>3248</sup> CARB, Detailed Comments, NHTSA-2018-0067-11873.

<sup>3249</sup> General Motors, Detailed Comments, NHTSA-2018-0067-11943.

fleet while allowing for more consumer choices. They further added that if the program is removed, manufacturers that currently generate credits from their fuel-efficient fleet may find it more profitable to begin producing less fuel-efficient vehicles, perhaps even halting the current improvements in fuel efficiency across the industry.<sup>3250</sup>

Honda commented that regulatory flexibilities, such as credit trading, built into the CO<sub>2</sub> and CAFE programs have become critical elements to the programs' success, especially in the face of product cadences with uneven sales that do not always match compliance obligations.<sup>3251</sup> General Motors stated its belief that program flexibilities will continue to play an increasingly important role in reducing CO<sub>2</sub> emissions and increasing fuel economy through technologies and innovations.<sup>3252</sup> CARB stated that existing flexibilities create consistency in compliance planning for automakers for model years in the existing program.<sup>3253</sup> Fiat Chrysler added that each of the CAFE and CO<sub>2</sub> programmatic tools and flexibilities should be retained, improved and strengthened. Fiat Chrysler opined that this is a chance for the agencies to make better policies that work more efficiently and as intended, and cautioned that eliminating them now could have the serious negative impact of making the standards more stringent and costlier for manufacturers.<sup>3254</sup>

NHTSA is not making changes to its credit trading provisions in the final rule. NHTSA sought comments on removing the optional credit trading program to explore public views on market distortions or windfalls that occur as a result of the credit trading program. However,

---

<sup>3250</sup> General Motors, Detailed Comments, NHTSA-2018-0067-11943.

<sup>3254</sup> Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943.

commenters consistently opined that removing existing flexibilities might result in manufacturers not building certain types of vehicles. This could adversely impact compliance plans over multiple model years. NHTSA concurs with those views, and since this final rule adopts CAFE standards that continuously increase through MY 2026, understands the importance of allowing for credit trading to provide additional means of achieving compliance for manufacturers who face varying degrees of difficulty in achieving the standards the agencies are finalizing today. With increasing standards, credit trading flexibilities help to compensate for the possibility of an uneven sales mix of vehicle types and to aid with compliance planning. Final sales volumes, as presented earlier, show a shift over the past several years in consumers purchasing more small SUVs subject to passenger car standards, and these vehicles are less fuel efficient than the compact and mid-sized passenger cars that previously dominated the market. The need to ensure consumer choice is adequately considered drives the need for NHTSA to provide credit trading flexibility to manufacturers. For example, even with increasing standards, a manufacturer could continue to sell certain types of vehicles with lower mpg performance over a longer period of time to satisfy its consumers by purchasing credits or carrying credits back from future model years to address the mpg fleet shortages caused by these vehicles, before ultimately having to introduce more fuel-efficient technologies. NHTSA believes that these types of scenarios are consistent with the purpose of the CAFE credit program, as adopted by Congress.

### *(3) Credit Transferring*

Credit “transfer” means the ability of manufacturers to move credits from their passenger car fleet to their light truck fleet, or vice versa. As part of the EISA amendments to EPCA, NHTSA was required to establish by regulation a CAFE credit transferring program, now codified at 49 CFR part 536, to allow a manufacturer to transfer credits between its car and truck

fleets to achieve compliance with the standards.<sup>3255</sup> For example, credits earned by overcompliance with a manufacturer's car fleet average standard may be used to offset debits incurred because of that manufacturer's failed to meet the truck fleet average standard in a given year. However, EISA imposed a cap on the amount by which a manufacturer could raise its CAFE performance through transferred credits: 1 mpg for MYs 2011-2013; 1.5 mpg for MYs 2014-2017; and 2 mpg for MYs 2018 and beyond.<sup>3256</sup> These statutory limits will continue to apply to the determination of compliance with CAFE standards. EISA also prohibits the use of transferred credits to meet the minimum domestic passenger car fleet CAFE standard.<sup>3257</sup>

In the NPRM, NHTSA responded to the 2016 petition for rulemaking from the Auto Alliance and Global Automakers (Alliance/Global or Petitioners) asking to amend the regulatory definition of "transfer" as it pertains to compliance flexibilities.<sup>3258</sup> In particular, Alliance/Global requested that NHTSA add text to the definition of "transfer" stating that the statutory transfer cap in 49 U.S.C. 32903(g)(3) applies when the credits are transferred. Alliance/Global assert that adding this text to the definition is consistent with NHTSA's prior position on this issue in the MYs 2012-2016 final rule, in which NHTSA stated:

NHTSA interprets EISA not to prohibit the banking of transferred credits for use in later model years. Thus, NHTSA believes that the language of EISA may be read to allow manufacturers to transfer credits from one fleet that has an excess number of credits, within the limits specified, to another fleet that may also have excess credits instead of

---

<sup>3255</sup> See 49 U.S.C. 32903(g)(1).

<sup>3256</sup> 49 U.S.C. 32903(g)(3).

<sup>3257</sup> 49 U.S.C. 32903(g)(4).

<sup>3258</sup> Auto Alliance and Global Automakers Petition for Direct Final Rule with Regard to Various Aspects of the Corporate Average Fuel Economy Program and the Greenhouse Gas Program (June 20, 2016) at 13, available at [https://www.epa.gov/sites/production/files/2016-09/documents/petition\\_to\\_epa\\_from\\_auto\\_alliance\\_and\\_global\\_automakers.pdf](https://www.epa.gov/sites/production/files/2016-09/documents/petition_to_epa_from_auto_alliance_and_global_automakers.pdf) [hereinafter Alliance/Global Petition].

transferring only to a fleet that has a credit shortfall. This would mean that a manufacturer could transfer a certain number of credits each year and bank them, and then the credits could be carried forward or back ‘without limit’ later if and when a shortfall ever occurred in that same fleet.<sup>3259</sup>

NHTSA clarified in the NPRM, based upon a previous interpretation, that the transfer cap from EISA does not limit how many credits may be *transferred* in a given model year, but it does limit the *application* of transferred credits to a compliance category in a model year.<sup>3260</sup>

The interpretation concludes by stating that, “Thus, manufacturers may transfer as many credits into a compliance category as they wish, but transferred credits may not increase a manufacturer’s CAFE level beyond the statutory limits.”<sup>3261</sup>

NHTSA maintains its views that the transfer caps in 49 U.S.C. 32903(g)(3) are properly read to apply to the application of credits. As NHTSA explained in the NPRM, it understands that the language in the MYs 2012-2016 final rule could be read to suggest that the transfer cap applies at the time credits are transferred. However, NHTSA believes its existing interpretation — that the transfer cap applies at the time the credits are used — is a more appropriate, plain language reading of the statute. While manufacturers have approached NHTSA with various interpretations that would essentially allow them to circumvent the EISA transfer cap, NHTSA believes such interpretations are improper because they would not give effect to the statutory transfer cap. Therefore, NHTSA proposed in the NPRM to deny Alliance/Global’s petition to revise the definition of “transfer” in 49 CFR 536.3, and is now finalizing that denial.

---

<sup>3259</sup> 75 FR 25666 (May 7, 2010).

<sup>3260</sup> See, letter from O. Kevin Vincent, Chief Counsel, NHTSA to Tom Stricker, Toyota (July 5, 2011), *available at* <https://isearch.nhtsa.gov/files/10-004142%20--%20Toyota%20CAFE%20credit%20transfer%20banking%20--%205%20Jul%2011%20final%20for%20signature.htm> (last accessed Apr. 18, 2018).

<sup>3261</sup> *Id.*

In response to the tentative denial of the petition above in the NPRM, comments were received from the Global Automakers and Toyota asking NHTSA to reconsider applying the transfer cap of 2.0 mpg per year when credits are transferred rather than when they are applied.<sup>3262</sup> They reiterated that imposing the cap when applying the credits is overly burdensome, but did not provide any new information that has persuaded NHTSA to change its view that the petition should be denied. The Auto Alliance also stated that NHTSA should revise its definition of “transfer” to be more consistent with EPA.<sup>3263</sup>

Other more general comments to the NPRM were also received from Walter Kreucher, Jeremy Michalek, Global Automakers, the Auto Alliance, and Toyota, regarding the use of the credit transfer flexibility. These commenters generally appreciated the transfer flexibility for its ability to reduce compliance costs.<sup>3264</sup> More specifically, Walter Kreucher commented that the ability to transfer credits between compliance categories was beneficial for manufacturers and allowed for efficiency in the markets and reduce compliance costs.<sup>3265</sup>

For the final rule, NHTSA is not making any changes to the existing provisions regarding transferring credits. NHTSA’s position remains unchanged that the transfer cap in 49 U.S.C. 32903(g)(1) clearly limits the amount of performance increase for a manufacturer’s fleet that fails to achieve the prescribed standards. The same statutory provision prevents NHTSA from changing its definition for transfer to be consistent with EPA. Consequently, NHTSA is not changing its definition or its previous interpretation that the application of transfer caps applies at

the time the credits are used and not when transferred. Therefore, NHTSA is finalizing its decision to deny the Auto Alliance and Global Automakers petition.

(4) *Minimum Domestic Passenger Car Standard*

EPCA, as amended by EISA, addresses the minimum domestic passenger car standard (MDPCS), clearly stating that any manufacturer’s domestically-manufactured passenger car fleet must meet the greater of either 27.5 mpg on average, or 92 percent of the average fuel economy projected by the Secretary for the combined domestic and non-domestic passenger automobile fleets manufactured for sale in the U.S. by all manufacturers in the model year, which projection shall be published in the Federal Register when the standard for that model year is promulgated in accordance with 49 U.S.C. 32902(b).<sup>3266</sup> Since that requirement was added to the statute, NHTSA has always calculated the “92 percent” as greater than 27.5 mpg. NHTSA published the 92 percent MDPCS for MYs 2017–2025 at 49 CFR 531.5(d) as part of the 2012 final rule. 49 CFR 531.5(e) explains that the published MDPCS for MYs 2022–2025 are not final and may change when NHTSA sets standards for those model years. This is consistent with the statutory requirement that the 92 percent standards must be determined at the time an overall passenger car standard is promulgated and published in the Federal Register.<sup>3267</sup> Any time NHTSA establishes or changes a passenger car standard for a model year, the MDPCS for that model year must also be evaluated or re-evaluated and established accordingly. Thus, this final rule establishes the applicable MDPCS for MYs 2021-2026.

---

<sup>3266</sup> 49 U.S.C. 32902(b)(4).

<sup>3267</sup> 49 U.S.C. 32904(b)(4)(B).

NHTSA considered comments received about the MDPCS, and discusses the comments and the agency’s assessment in Section VIII.B.1.b).

Table IX-7 lists the minimum domestic passenger car standards and compares them to standards that would correspond to each of the other regulatory alternatives considered. NHTSA has updated these to reflect its overall analysis and resultant projection for the CAFE standards finalized today, highlighted below as “Preferred (Alternative 3),” and has calculated what those standards would be under the no action alternative (as issued in 2012, as updated for the NPRM, and as further updated by today’s analysis) and under the other alternatives described and discussed further in Section V, above.

**Table IX-7 – Minimum Standards for Domestic Passenger Car Fleets**

<b>Alternative</b>	<b>2021</b>	<b>2022</b>	<b>2023</b>	<b>2024</b>	<b>2025</b>	<b>2026</b>

Alternative 7	41	41.9	42.7	43.6	44.5	45.4

(5) *Fuel Savings Adjustment Factor*

Under NHTSA’s credit trading regulations, a fuel savings adjustment factor is applied when trading occurs between manufacturers or when a manufacturer transfers credits between its fleets, but not when a manufacturer carries credits forward or carries back credits within the

same fleet.<sup>3268</sup> The Alliance/Global requested in their 2016 petition that NHTSA require manufacturers to apply the fuel savings adjustment factor when credits are carried forward or carried back within the same fleet, including for existing, unused credits.

Per EISA, total oil savings must be preserved in NHTSA's credit trading program.<sup>3269</sup> The statutory provisions for credit transferring within a manufacturer's fleet do not explicitly include the same requirement; however, NHTSA prescribed a fuel savings adjustment factor that applies to both credit trades between manufacturers and credit transfers between a manufacturer's compliance fleets.<sup>3270, 3271</sup>

When NHTSA initially considered the preservation of oil savings, the agency explained how one credit is not necessarily equal to another. For example, the fuel savings lost if the average fuel economy of a manufacturer falls one-tenth of an mpg below the level of a relatively low standard are greater than the average fuel savings gained by raising the average fuel economy of a manufacturer one-tenth of a mpg above the level of a relatively high CAFE standard.<sup>3272</sup> The effect of applying the adjustment factor is to increase the numerical value of credits for compliance accounting that are earned for exceeding a CAFE standard, that are applied to a compliance category with a higher CAFE standard. Likewise, the adjustment factor

---

<sup>3268</sup> See 49 CFR 536.4(c).

<sup>3269</sup> 49 U.S.C. 32903(f)(1).

<sup>3270</sup> 49 U.S.C. 32903(g).

<sup>3271</sup> See 49 CFR 536.5; see also 74 FR 14430 (Mar. 30, 2009) (Per NHTSA's final rule for MY 2011 Average Fuel Economy Standards for Passenger Cars and Light Trucks, "There is no other clear expression of congressional intent in the text of the statute suggesting that NHTSA would have authority to adjust transferred credits, even in the interest of preserving oil savings. However, the goal of the CAFE program is energy conservation; ultimately, the U.S. would reap a greater benefit from ensuring that fuel oil savings are preserved for both trades and transfers. Furthermore, accounting for traded credits differently than for transferred credits does add unnecessary burden on program enforcement. Thus, NHTSA will adjust credits both when they are traded and when they are transferred so that no loss in fuel savings occurs.").

<sup>3272</sup> 74 FR 14432 (Mar. 30, 2009).

has the effect of decreasing the numerical value of credits for compliance accounting that are earned for exceeding a CAFE standard, that are applied to a compliance category with a lower CAFE standard. While applying the adjustment factor impacts the compliance accounting value of credits which are denominated in miles per gallon, the adjustment maintains the real world value of credits from the perspective of the actual amount of fuel consumed or saved.

Alliance/Global stated, in its 2016 petition, that while carry-forward and carryback credits have been used for many years, the CAFE standards did not change during the Congressional CAFE freeze, meaning credits earned during those years were associated with the same amount of fuel savings from year to year.<sup>3273</sup> Alliance/Global suggest that because there is no longer a Congressional CAFE freeze, NHTSA should apply the adjustment factor when moving credits within a manufacturer's fleet (i.e. carry-forward or carryback) beginning retroactively in MY 2011.<sup>3274</sup>

In the NPRM, NHTSA tentatively denied Alliance/Global's request to apply the fuel savings adjustment factor to credits that are carried forward or carried back within the same fleet to the extent that the request would impact credits carried forward or back retroactively within manufacturers' compliance fleets (i.e., credits that were generated prior to MY 2021 when the standards set by this rule first apply). NHTSA tentatively determined that applying the adjustment factor to credits earned in prior model years would be inequitable to apply retroactively. There would be an advantage for manufacturers carrying credits into future model years with higher CAFE standards. Manufacturers have historically planned compliance

---

<sup>3273</sup> Alliance/Global Petition at 10.

<sup>3274</sup> Alliance/Global Petition at 4.

strategies based, at least in part, on the existing rules for how credits could be carried forward and back, including the lack of an adjustment factor when credits are carried forward or back within the same fleet. Thus, retroactively requiring an adjustment factor could disadvantage certain manufacturers without credits, and result in windfalls for other manufacturers.

To explore the impact on future model years, NHTSA sought additional comments in the NPRM on the feasibility of applying the fuel savings adjustment factor to credits carried forwards or back starting in MY 2021. Global Automakers submitted new comments arguing that the application of fuel savings adjustment factors to credits carried forward or back would not result in a credit windfall. They believed this practice would ensure that credits have a consistent value over time.<sup>3275</sup>

Comments from Global Automakers provided no further justification that would persuade NHTSA to consider changing its position on denying the application of the adjustment factor to carry-forward and carryback credits beginning with MY 2011. NHTSA continues to be concerned about the inequitable outcome retroactive adjustments would have on the credit market. Therefore, NHTSA is finalizing its decision to deny the Alliance/Global request to apply the adjustment factor to credits carried forward or carried back within a compliance category retroactively beginning as early as MY 2011.

Congress expressly required that DOT establish a credit “transferring” regulation, to allow individual manufacturers to move credits from one of their fleets to another (e.g., using a

---

<sup>3275</sup> Global Automakers, Detailed Comments, NHTSA-2018-0067-12032.

credit earned for exceeding the light truck standard for compliance with the domestic passenger car standard). Congress also gave DOT discretion to establish a credit “trading” regulation so that credits may be bought and sold between manufacturers.<sup>3276</sup> Congress specified that trading was for earned credits “to be sold to manufacturers whose automobiles fail to achieve the prescribed standards such that the total oil savings associated with manufacturers that exceed the prescribed standards are preserved.”<sup>3277</sup> NHTSA established 49 CFR part 536 believing it was consistent with the statute for transferred credits to be subject to the same “adjustment factor” to ensure total oil savings are preserved.<sup>3278</sup> NHTSA believed that no further application of the adjustment factor to other credit flexibilities would be appropriate at that time. NHTSA sought comments in the NPRM to explore the consequences associated with applying the adjustment factor to credits carried forward and back starting in MY 2021, but no further insight was gained from the comments received. Therefore, NHTSA is retaining its existing requirements for the adjustment factor to be applied to transferred and traded credits only. NHTSA will continue considering potential application of the adjustment factor for all types of credit flexibilities in the future, and may consider regulatory changes in subsequent rulemakings.

(6) *VMT Estimates for Fuel Savings Adjustment Factor*

NHTSA uses the vehicle miles traveled (VMT) estimate as part of its fuel savings adjustment equation to ensure that when traded or transferred credits are used, fuel economy credits are adjusted to ensure fuel oil savings is preserved.<sup>3279</sup> For MYs 2017-2025, NHTSA

---

<sup>3276</sup> 49 U.S.C. 32903(f).

<sup>3277</sup> 49 U.S.C. 32903(f)(1).

<sup>3278</sup> 74 FR 14196, 14434 (Mar. 30, 2009).

<sup>3279</sup> See 49 CFR 536.4(c).

finalized VMT values of 195,264 miles for passenger car credits, and 225,865 miles for light truck credits.<sup>3280</sup> These VMT estimates harmonized with those used in EPA's CO<sub>2</sub> program. For MYs 2011-2016, NHTSA estimated different VMTs by model year.

In the NPRM, NHTSA explained that Alliance/Global requested in their 2016 petition that NHTSA apply fixed VMT estimates to the fuel savings adjustment factor for MYs 2011-2016 similar to how NHTSA handled VMT values for MYs 2017-2025.<sup>3281</sup> NHTSA rejected a similar request from the Auto Alliance in the MY 2017 and later rulemaking, citing lack of scope, and expressing concern about the potential loss of fuel savings.<sup>3282</sup>

The Alliance/Global argued that data from MYs 2011-2016 demonstrate that no fuel savings would have been lost, as was NHTSA's concern.<sup>3283</sup> Alliance/Global asserted that by not revising the MY 2012-2016 VMT estimates, credits earned during that timeframe were undervalued.<sup>3284</sup> Therefore, Alliance/Global argued that NHTSA should retroactively revise its VMT estimates to "reflect better the real-world fuel economy results."<sup>3285</sup>

Such retroactive adjustments could have unfair adverse effects upon manufacturers for decisions they made based on the regulations as they existed at the time. As Alliance/Global acknowledged, adjusting VMT estimates would disproportionately affect manufacturers that have a credit deficit and were part of EPA's Temporary Lead-time Allowance Alternative Standards (TLAAS). The TLAAS program sunsets for MYs 2021 and later. Given that some

---

<sup>3284</sup> *Id.*

<sup>3285</sup> Alliance/Global Petition at 11.

manufacturers would be disproportionately affected were NHTSA to adopt Alliance/Global's proposal, in the NPRM, NHTSA tentatively denied Alliance/Global's request to change the agency's VMT schedules for MYs 2011-2016 retroactively. Alliance/Global's suggestion that a TLAAS manufacturer should be allowed to elect either approach does not change the fact that manufacturers in the TLAAS program made production decisions based on the regulations as understood at the time.<sup>3286</sup> NHTSA sought comments on the Alliance/Global requests in the NPRM.

However, no further comments were received on this issue in response to the NPRM. Therefore, NHTSA is finalizing its decision to deny the Alliance/Global request to modify the VMT schedules for MYs 2011-2016.

*(7) Special Fuel Economy Calculations for Dual and  
Alternative Fueled Vehicles*

As discussed at length in prior rulemakings, EPCA, as amended by EISA, encouraged manufacturers to build alternative-fueled and dual- (or flexible-) fueled vehicles by providing special fuel economy calculations for "dedicated" (that is, 100 percent ) alternative fueled vehicles and "dual-fueled" (that is, capable of running on either the alternative fuel or gasoline/diesel) vehicles.

Dedicated alternative-fuel automobiles include electric, fuel cell, and compressed natural gas vehicles, among others. The statutory provisions for dedicated alternative fuel vehicles in 49

---

<sup>3286</sup> See *id.* at 11-12, n.12.

U.S.C. 32905(a) state that the fuel economy of any dedicated automobile manufactured after MY 1992 shall be measured “based on the fuel content of the alternative fuel used to operate the automobile. A gallon of liquid alternative fuel used to operate a dedicated automobile is deemed to contain 0.15 gallon of fuel.” Under EPCA, for dedicated alternative fuel vehicles, there are no limits or phase-out for this special fuel economy calculation, unlike for dual-fueled vehicles, as discussed below.

EPCA’s statutory incentive for dual-fueled vehicles at 49 U.S.C. 32906 and the measurement methodology for dual-fueled vehicles at 49 U.S.C. 32905(b) and (d) expire after MY 2019; therefore, NHTSA had to examine the future of these provisions in the MY 2017 and later CAFE rulemaking. NHTSA and EPA concluded that it would be inappropriate to measure dual-fueled vehicles’ fuel economy like that of conventional gasoline vehicles with no recognition of their alternative fuel capability, which would be contrary to the intent of EPCA/EISA. The agencies determined that for MY 2020 and later vehicles, the general statutory provisions authorizing EPA to establish testing and calculation procedures provide discretion to set the CAFE calculation procedures for those vehicles. The methodology for EPA’s approach is outlined in the 2012 final rule for MYs 2017 and later at 77 FR 63128 (Oct. 15, 2012). In the NPRM, NHTSA sought comments on that current approach.

NHTSA received comments from the Coalition for Renewable Natural Gas, NGV America, the American Gas Association, the American Public Gas Association, CARB, Ingevity Corporation, Fuel Freedom Foundation, UCS, National Farmers Union, Indiana Corn Growers Association, Volkswagen, and a joint submission from Ariel Corp. and VNG.co.

Fuel Freedom Foundation and the National Farmers Union asserted that the agencies should continue offering incentives for emerging technology vehicles including natural gas vehicles, internal combustion engine (ICE) vehicles that encourage renewable fuel use, electric and hydrogen fuel cell vehicles, flex-fuel vehicles (FFVs), and dedicated high-octane vehicles designed for compatibility with mid-level ethanol blends.<sup>3287</sup>

Indiana Corn Growers Association and Fuel Freedom Foundation specified that FFVs, as well as vehicles that run on mid-level ethanol blends, should receive credit for the petroleum reduction value.<sup>3288</sup> For vehicles using higher-ethanol blends, these commenters stated that the agencies should establish more accurate petroleum equivalency factors for the proportion of ethanol versus gas.<sup>3289</sup> Clean Fuels Development Coalition requested credits for producing “Engines Optimized for High-Octane” be reinstated.<sup>3290</sup> Volkswagen made the same request and added that a pathway to higher-octane fuel is important to it.<sup>3291</sup>

Ariel Corp. and VNG.co, the Coalition for Renewable Natural Gas, NGVAmerica, the American Gas Association, and the American Public Gas Association commented that the agencies should expand incentives for natural gas vehicles in the light-duty sector especially for pick-up trucks, work vans, and sport utility vehicles.<sup>3292</sup> They argued that current incentives are

<sup>3290</sup> Clean Fuels Development Coalition, Detailed Comments, NHTSA-2018-0067-12031.

<sup>3291</sup> Volkswagen, Detailed Comments, NHTSA-2017-0069-0583.

<sup>3292</sup> Joint submission from Ariel Corp and VNG.co LLC, Detailed Comments, NHTSA-2018-0067-7573; Joint submission from the Coalition for Renewable Natural Gas, NVG America, the American Gas Association, and American Public Gas Association, Detailed Comments, NHTSA-2018-0067-11967.

not strong enough to induce manufacturers to produce natural gas vehicles. They further requested that the market penetration rates be removed for light-duty trucks.<sup>3293</sup>

The Coalition for Renewable Natural Gas, NGVAmerica, the American Gas Association, and the American Public Gas Association argued that an AMFA factor of 0.15 is low and because some natural gas vehicles can operate at 100 percent natural gas, a higher fuel economy credit is justified. They further supported a permanent use of the 0.15 factor for dual-fuel vehicles.<sup>3294</sup> Similarly, Ingevity Corporation, and Ariel Corp. and VNG.co argued that natural gas vehicle emissions should return to the 0.15 divisor.<sup>3295</sup>

Ingevity Corporation, Ariel Corp. and VNG.co, the Coalition for Renewable Natural Gas, NGVAmerica, the American Gas Association, and the American Public Gas Association requested that the agencies remove the minimum driving range of natural gas compared to gasoline and “drive to empty” design requirements for dual-fueled natural gas vehicles and allow higher utility factors based on driving range only, so that dual-fuel NGVs are treated similarly to PHEVs. They stated a belief that the design constraints for dual-fuel NGVshold NGVs to an unfairly higher standard.<sup>3296</sup> As discussed above in Section IX.B, EPA is removing these design constraints for dual-fuel NGVs.

---

<sup>3293</sup> See, e.g., joint submission from the Coalition for Renewable Natural Gas, NGVAmerica, the American Gas Association, and the American Public Gas Association, Detailed Comments, NHTSA-2018-0067-11967.

<sup>3295</sup> Ingevity Corporation, Detailed Comments, NHTSA-2018-0067-8666; Joint submission from Ariel Corp. and VNG.co LLC, Detailed Comments, NHTSA-2018-0067-7573.

<sup>3296</sup> Ingevity, Detailed Comments, NHTSA-2018-0067-8666; Joint submission from Ariel Corp. and VNG.co LLC, Detailed Comments, NHTSA-2018-0067-7573; Joint submission from The Coalition for Renewable Natural Gas, NGVAmerica, the American Gas Association, the American Public Gas Association, Detailed Comments, NHTSA-2018-0067-11967.

CARB argued that flexibilities for natural gas vehicles and high-octane blend vehicles are not yet warranted.<sup>3297</sup> Similarly, UCS argued that natural gas is a greenhouse gas and benefits from natural gas vehicles are undermined by their costs. UCS further commented that natural gas vehicle technology does not need any incentives since it has already been deployed and in the market.<sup>3298</sup>

In response to comments, NHTSA has determined that EPCA and EISA prescribe the incentive that is used for dedicated liquid and gaseous alternative fuel vehicles, and the CAFE program will continue to use those statutory incentives. For dedicated alternative fuel vehicles, the statute provides a significant incentive that only counts 15 percent of the actual energy used.<sup>3299</sup> For dual fuel vehicles, NHTSA has determined that, for the portion of operation that occurs on an alternative fuel, it is consistent to use the same incentive that is specified by EPCA and EISA for dedicated fuel vehicles. For example, for the hypothetical case of a vehicle that operates 99 percent of the time on an alternative fuel, it would be appropriate for that vehicle to receive nearly the same incentive as a dedicated alternative fuel vehicle that operates 100 percent of the time on alternative fuel. Applying the same 15 percent of energy used incentive for both dedicated and dual fuel vehicles remains appropriate. NHTSA therefore is not adopting any new incentives for any alternative fueled vehicles.

---

<sup>3297</sup> CARB, Detailed Comments, NHTSA-2018-0067-11873.

<sup>3298</sup> UCS, Detailed Comments, NHTSA-2018-0067-12039.

<sup>3299</sup> 32905(a) "... A gallon of a liquid alternative fuel used to operate a dedicated automobile is deemed to contain .15 gallon of fuel." 32905(c) "... One hundred cubic feet of natural gas is deemed to contain .823 gallon equivalent of natural gas. The Secretary of Transportation shall determine the appropriate gallon equivalent of other gaseous fuels. A gallon equivalent of gaseous fuel is deemed to have a fuel content of .15 gallon of fuel."

#### D. Compliance Issues that Affect Both the CO<sub>2</sub> and CAFE Programs

Because the real world CO<sub>2</sub> emissions reduction benefits of certain technologies cannot be measured or fully measured using 2-cycle test procedures, EPA established new compliance flexibilities under its CAA authority, starting in MY 2012, that allow manufacturers credit for emission compliance for installing these technologies. Those flexibilities are designed to recognize improvements in A/C systems with greater efficiency and other “off-cycle” technologies that reduce real world tailpipe CO<sub>2</sub> emissions. More specifically, real world improvements that cannot be measured or fully measured on 2-cycle tests are determined and used to calculate additional CO<sub>2</sub> credits (in Megagrams (Mg)) for each model type that has the technologies. Because these tailpipe CO<sub>2</sub> improving technologies also impact fuel economy, NHTSA adopted the same flexibilities and incentives beginning in MY 2017. EPA and NHTSA also established incentives for both the CO<sub>2</sub> and CAFE programs that give added compliance credits and fuel consumption improvement values for the production of strong and mild hybrid full-size pickup trucks beginning in MY 2017.<sup>3300</sup> EPA adjusts manufacturers’ CAFE performance values using the emissions benefits or incentives provided for these technologies. EPA developed a methodology for manufacturers to increase their passenger car and light truck fuel economy performance in accordance with procedures set forth by EPA in 40 CFR part 600. For the NHTSA CAFE program, the CO<sub>2</sub> reductions (in grams per mile) are converted to fuel consumption improved values (FCIVs, gallons per mile) and then the benefits are summed for all

---

<sup>3300</sup> See 40 CFR 86.1867-86.1868, 86.1870.

the model types in the manufacturer's fleets. The total FCIVs are used to adjust and increase manufacturers' CAFE (mpg) performance values.

It is important to note that while these flexibilities and incentives have similar value for compliance in the CAFE and CO<sub>2</sub> programs, there are differences in how they are accounted for in each of the programs due to differences in the structure of the programs. The CAFE program accounts for A/C efficiency and off-cycle improvements through EPA measurement procedures that determine *fuel consumption improvement values* (FCIVs). The CAFE A/C efficiency and off-cycle provisions do not involve manufacturer *credits*.<sup>3301</sup> There are no bankable, tradable, or transferrable credits earned by a manufacturer for implementing more efficient A/C systems or installing an off-cycle technology. In fact, the only credits provided for in NHTSA's CAFE program are those earned by overcompliance with a standard.<sup>3302</sup> As discussed above, EPA adjusts CAFE performance values based on the FCIVs generated through the use of these technologies. Off-cycle technologies and A/C efficiency improvements represent adjustments to individual vehicle compliance values based on the fuel consumption improvement values of these technologies.

Illustrative of this confusion, in the 2016 Alliance/Global petition, the petitioners asked NHTSA to avoid imposing unnecessary restrictions on the use of credits. Alliance/Global referenced language from an EPA report that stated compliance is assessed by measuring the tailpipe emissions of a manufacturer's vehicles, and then reducing vehicle CO<sub>2</sub> compliance

---

<sup>3301</sup> This is not to be confused with EPA's parallel program, which refers to the GHG's consideration of A/C improvements and off-cycle technologies as "credits."

<sup>3302</sup> 49 U.S.C. 32903.

values depending on A/C efficiency improvements and off-cycle technologies.<sup>3303</sup> This language is consistent with NHTSA’s statement in the MY 2017 and later final rule, which explained how the agencies coordinate and apply off-cycle and A/C adjustments. “There will be separate improvement values for each type of credit, calculated separately for cars and for trucks. These improvement values are subtracted from the manufacturer’s 2-cycle-based fleet fuel consumption value to yield a final new fleet fuel consumption value, which would be inverted to determine a final fleet fuel CAFE value.”<sup>3304</sup>

In the NPRM, NHTSA proposed to deny Alliance/Global’s request because what the petitioners refer to as “technology credits” are actually FCIVs applied to the fuel economy performance of individual vehicles.<sup>3305</sup> Thus, these adjustments are not actually “credits,” per the usage of “credit” in EPCA/EISA and are not subject to the “carry-forward” and “carryback” provisions in 49 U.S.C. 32903. To alleviate confusion, and to ensure consistency in nomenclature, NHTSA proposed to update language in its regulations to reflect that the use of the term “credits” to refer to A/C efficiency and off-cycle technology adjustments should actually be termed fuel consumption improvement values (FCIVs). No further comments were received on this issue in response to the NPRM. For the final rule, NHTSA is finalizing the proposed changes in its regulations to remove the term “credits” and to replace it with the term “adjustments” for the FCIV benefit for A/C and off-cycle technologies in the CAFE program.

---

<sup>3303</sup> See Alliance/Global Petition at 15.

<sup>3304</sup> 77 FR 62726 (Oct. 15, 2012).

<sup>3305</sup> The agencies also refer to A/C and off-cycle technology improvement values as “credits” sporadically throughout their regulations. NHTSA is amending its regulations to reflect these are adjustments and not actual credits that can be carried forward or back. For a further discussion, see above.

Manufacturers seeking to use these flexibilities and incentives start the process each model year by submitting information to EPA and seeking any necessary approvals, as appropriate. The use of certain technologies only requires submitting information to EPA, whereas others require a formal request process for approval. The differences are explained in the following sections. The compliance information manufacturers must submit to EPA describes the technologies, the flexibilities or incentives being used, and the testing approach for deriving benefits. Initial information is required as a part of the EPA certification process, as specified by 40 CFR 86.1843-01 in advance of each model year. For technologies requiring approvals, EPA must confirm the manufacturer's testing approach, receive test results to assess the benefit of the technology, and then where applicable issue a *Federal Register* notice that invites public comment. EPA review and determination usually occurs before the end of the compliance model year, if manufacturers provide information to EPA on a timely basis. To receive the benefit under the CAFE program for technologies that require approvals, manufacturers must concurrently submit to NHTSA the same information that is sent to EPA. EPA consults with NHTSA in reviewing A/C efficiency and off-cycle adjustments to fuel economy performance values that require approval. NHTSA provides EPA its assessment of the suitability of a technology considering: (1) whether the technology has a direct impact upon improving fuel economy performance; (2) whether the technology is related to crash-avoidance technologies, safety critical systems or systems affecting safety-critical functions, or technologies designed for the purpose of reducing the frequency of vehicle crashes; (3) information from any assessments conducted by EPA related to the application, the technology, and/or related technologies; and (4) any other relevant factors.

EPA and NHTSA sought comments on several aspects of the shared flexibilities and incentives in the NPRM. Presented in the following sections is a summary of the comments received and the agencies final decisions for the final rule.

1. Incentives for Advanced Technologies in Full-Size Pickup Trucks

In the 2012 rulemaking for MYs 2017 and beyond, EPA and NHTSA created incentives to encourage implementation of hybrid electric full size pickup trucks for both the CO<sub>2</sub> and CAFE programs. CO<sub>2</sub> credits and CAFE FCIVs were made available for manufacturers that produce full-size pickup trucks with Mild HEV or Strong HEV technology, provided the percentage of production with the technology is greater than specified percentages.<sup>3306</sup> In addition, CO<sub>2</sub> credits and CAFE FCIVs were made available for manufacturers that produce full-size pickups with other technologies that enables full size pickup trucks to exceed performance of their CO<sub>2</sub> or CAFE targets based on footprints by specified amounts.<sup>3307</sup> These performance-based incentives created a technology-neutral path (as opposed to the other technology-encouraging path) to achieve the CO<sub>2</sub> credits and CAFE FCIVs, which would encourage the development and application of new technological approaches.

EPA and NHTSA established limits on the vehicles eligible to qualify for these incentives; a truck must meet minimum criteria for bed size and towing or payload capacity, and meet minimum production thresholds (in terms of a percentage of a manufacturer's full-size pickup truck fleet) in order to qualify for the incentives. As designed, the strong hybrid credit is

---

<sup>3306</sup> 77 FR 62651 (Oct. 15, 2012).

<sup>3307</sup> *Id.*

20 grams/mile per vehicle, available through MY 2025, if installed on at least 10 percent of the manufacturer's full-size pickup truck fleet in the model year. The program also included an incentive for mild hybrids of 10 grams/mile per vehicle during MYs 2017–2021. To be eligible the manufacturer would have to show that the mild hybrid technology is utilized in a specified portion of its truck fleet beginning with at least 20 percent of a company's full-size pickup production in MY 2017 and ramping up to at least 80 percent in MY 2021.<sup>3308</sup>

At present, no manufacturer has qualified to use the full-size pickup truck incentives. One vehicle manufacturer introduced a mild hybrid pickup truck for MY 2019 but did not meet the minimum production threshold. Others have announced potential collaborations, or have already started production on future hybrid or electric models.<sup>3309</sup>

Prior to the NPRM, the agencies received input from automakers that these incentives should be extended and available to all light-duty trucks (e.g., cross-over vehicles, minivans, sport utility vehicles, and smaller-sized pickups) and not only full-size pickup trucks.<sup>3310</sup>

Automakers also recommended that the program's eligibility production thresholds should be removed because they discourage the application of technology since manufacturers cannot be

---

<sup>3308</sup> 77 FR 62651-2 (Oct. 15, 2012).

<sup>3309</sup> Chrysler released the 2019 Dodge Ram 1500 "eTorque" (*see* <https://www.fueleconomy.gov/feg/Find.do?action=sbs&id=40736&id=40737&id=40394&id=40397>) which qualifies as a mild hybrid pickup truck by replacing the traditional alternator on the engine with a 48-volt Li-ion battery-powered, belt-driven motor generator that improves performance, efficiency, payload, towing capabilities and drivability. The production volume of these vehicles did not qualify for the full-size pickup truck electric/hybrid incentive for MY 2019. Other vehicle models are currently in research or in development for future years but it is uncertain whether they will reach the required sales volumes to qualify for incentives. For example, *the hybrid and battery-electric versions of the F-150 pickup*, *see* <https://www.trucks.com/2019/09/18/ford-truck-engineer-explains-electric-f-150-pickup-plans> (September 18, 2019), or the new electric pickup truck manufactured by Rivian, <https://www.trucks.com/2019/04/24/ford-plans-new-electric-truck-rivian-invests-500-million/> (April 24, 2019); or the Tesla all electric pickup truck (<https://www.cnn.com/2019/11/08/success/tesla-pickup-reveal/index.html>) (November 8, 2019).

<sup>3310</sup> 83 FR 43461 (Aug. 24, 2018).

confident of achieving the thresholds. Some stakeholders have also suggested an additional incentive for strong and mild hybrid passenger cars. In the proposal, the agencies sought comment on whether these incentives should be expanded along the lines suggested by stakeholders, on the basis that perhaps these incentives could lead to additional product offerings of strong hybrids, and technologies that offer similar emissions reductions, which could enable manufacturers to achieve additional long-term CO<sub>2</sub> emissions reductions. In addition, the agencies sought comment on whether to extend either the incentive for hybrid full-size pickup trucks or the performance-based incentive past the dates that EPA specified in the 2012 final rule for MY 2017 and later. The agencies also sought comment on eliminating incentive programs, as discussed above.

The agencies received a variety of comments on the full-size pickup truck incentives. Comments were received from General Motors, Volkswagen, Honda, BorgWarner, Fiat Chrysler, Toyota, DENSO International, Ford, CARB, Global Automakers, UCS, Electric Drive Transportation Association, the Auto Alliance, Ariel Corp. and VNG.co, ACEEE, the Coalition for Renewable Natural Gas, NGVAmerica, the American Gas Association, and the American Public Gas Association.

The Auto Alliance, Toyota, General Motors, BorgWarner, Global Automakers, and Volkswagen advocated to expand the full-size pickup truck hybrid incentives to all hybrid vehicles.<sup>3311</sup> They argued that prices for all hybrid-drive technologies are projected to remain

---

<sup>3311</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073; Toyota, Detailed Comments, NHTSA-2018-0067-12150; General Motors, Detailed Comments, NHTSA-2018-0067-11858; BorgWarner, Detailed Comments, NHTSA-2018-0067-11895; Global Automakers, Detailed Comments, NHTSA-2018-0067-12032; Volkswagen, Detailed Comments, NHTSA-2017-0069-0583.

high and consumer demand for these vehicles is still slow to increase.<sup>3312</sup> They asserted that expanding the full-size pickup truck hybrid incentive to all hybrid vehicles will help encourage investments in hybrid technology and continue to help manufacturers address their compliance challenges.<sup>3313</sup> Similarly, these commenters reported that the current market, fueled by consumer demand for SUVs and lower than expected gas prices, is not conducive to consumer acceptance of or demand for electric vehicles.<sup>3314</sup> For these reasons, they stated their belief that it is important to support adjustments and expansion of the current incentives to promote hybrid technologies.

The Auto Alliance, DENSO International, Global Automakers, Fiat Chrysler, and Honda also argued for alternative pathways for the agencies to consider allowing the full-size pickup truck hybrid incentives to be expanded to the light-duty truck segment, but not to all passenger vehicles. They argued that hybrid technology has been slow to be applied in the light-duty truck segment, but has been broadly applied to passenger cars.<sup>3315</sup>

Toyota, Global Automakers, and the Auto Alliance suggested the incentives for light-duty trucks should amount to 20 grams/mile.<sup>3316</sup> Global Automakers added that in addition to expanding full-size pickup truck hybrid incentives to light trucks, the agency should consider a

---

<sup>3316</sup> Toyota, Detailed Comments, NHTSA-2018-0067-12150; Global Automakers, Detailed Comments, NHTSA-2018-0067-12032; Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

smaller incentive for hybrid electric passenger vehicles as well.<sup>3317</sup> The Auto Alliance and Toyota suggested a 10 grams/mile credit for passenger cars.<sup>3318</sup> Volkswagen further requested the hybrid pickup credit to be expanded to all hybrid cars and trucks.<sup>3319</sup>

Toyota, the Auto Alliance, Electric Drive Transportation Association, Ford, DENSO International, Global Automakers, Fiat Chrysler, and BorgWarner commented that having minimum production percentages for hybrid pickup trucks discourages manufacturers from investing in hybrid technologies. They requested that the agencies consider eliminating the percentage of production requirement and provide incentives in proportion to the value of the technology.<sup>3320</sup> Ford stated that the minimum production percentages unfairly penalize larger manufacturers who must produce more pickup trucks to claim the incentives than a smaller volume manufacturer.<sup>3321</sup>

Ariel Corp. and VNG.co, the Coalition for Renewable Natural Gas, NGVAmerica, the American Gas Association, and the American Public Gas Association commented the pickup truck incentives should be expanded to include natural gas vehicles.<sup>3322</sup> They suggested a

“Natural Gas Pickup” incentive like the hybrid-electric and performance-based pickup credits, but no minimum production requirement.<sup>3323</sup>

ACEEE and UCS commented that hybrid technology has been around for quite a while and has been applied in every vehicle class. They discouraged the agencies from applying more incentives to these vehicles.<sup>3324</sup> Specifically, UCS stated that incentives for electric vehicles are mostly driven by state regulation, and EPA and NHTSA policies are rewarding manufacturers for meeting standards they were already required to meet.<sup>3325</sup> UCS commented that hybrids are not innovators or game-changing vehicles—they are simply one of many strategies by which manufacturers can reduce emissions and should not receive special treatment.<sup>3326</sup>

CARB commented that incentives for full-size hybrid pickup trucks should remain limited in their scope and that increasing or expanding those incentives can erode emissions benefits.<sup>3327</sup> CARB further commented that hybrid electric vehicles (HEVs) are widely available at varying levels of power and performance across vehicle sizes, and CARB does not believe HEVs deserve special treatment in the CO<sub>2</sub> vehicle regulations.

After carefully considering the comments received, EPA and NHTSA are not adopting any new or expanded incentives for hybrid vehicles or full-size pickup trucks, and are removing these incentives beginning in MY 2022 (the incentive for mild hybrids expires after MY 2021 regardless, so that does not change). The agencies believe any new or expanded incentives

---

<sup>3323</sup> See, e.g., Joint submission from Ariel Corp. and VNG.co, Detailed Comments, NHTSA-2018-0067-7573.

<sup>3324</sup> ACEEE, Detailed Comments, NHTSA-2018-0067-12122-29; UCS, Detailed Comments, NHTSA-2018-0067-12039.

<sup>3325</sup> UCS, Detailed Comments, NHTSA-2018-0067-12039.

<sup>3326</sup> UCS, Detailed Comments, NHTSA-2018-0067-12039.

<sup>3327</sup> CARB, Detailed Comments, NHTSA-2018-0067-11873.

would likely not result in any further emissions benefits or fuel economy improvements since an increase in sales volume would not be expected. The agencies agree with CARB and ACEEE, and UCS that hybrids are a well-established technology that has already been applied to a wide range of vehicles and, as such, no further incentives are warranted at this time. Further, the agencies believe that incentivizing manufacturers to implement specific technologies is inappropriate, as manufacturer fuel economy performance should represent actual fuel consumption. The agencies believe any new or expanded incentives for hybrids would likely not result in any further emissions benefits or fuel economy improvements beyond those measured during testing; to the extent that manufacturers choose to build full-size pickup trucks that exceed their targets, those will reap the benefits of target exceedance in the overall fleet averaging. Manufacturers did not provide sufficient evidence to support their position in a manner that leads the agencies to conclude otherwise, and there does not appear to be any likelihood that manufacturers will be able to take advantage of these flexibilities beyond MY 2021 that makes it necessary to retain them. Therefore, the agencies are removing these flexibilities from the program starting with MY 2022.

## 2. Flexibilities for Air Conditioning Efficiency

A/C systems are virtually standard automotive accessories, and more than 95 percent of new cars and light trucks sold in the U.S. are equipped with mobile A/C systems. A/C system usage places a load on an engine, which results in additional tailpipe CO<sub>2</sub> emissions and fuel consumption; the high penetration rate of A/C systems throughout the light-duty vehicle fleet means that efficient systems can significantly impact the total energy consumed and CO<sub>2</sub>

emissions. A/C systems also have non-CO<sub>2</sub> emissions associated with refrigerant leakage.<sup>3328</sup> Manufacturers can improve the efficiency of A/C systems through redesigned and refined A/C system components and controls.<sup>3329</sup> That said, such improvements are not measurable or recognized using 2-cycle test procedures, since A/C is turned off during 2-cycle testing. Any A/C system efficiency improvements that reduce load on the engine and improve fuel economy is therefore not measurable on those tests.

The CO<sub>2</sub> and CAFE programs include flexibilities to account for the real world CO<sub>2</sub> emissions and fuel economy improvements associated with improved A/C systems and to include the improvements for compliance.<sup>3330</sup> The total of A/C efficiency credits is calculated by summing the individual credit values for each efficiency improving technology used on a vehicle, as specified in the A/C credit menu. The total A/C efficiency credit sum for each vehicle is capped at 5.0 grams/mile for cars and 7.2 grams/mile for trucks. Additionally, the off-cycle credit program contains credit earning opportunities for technologies that reduce the thermal loads on a vehicle from environmental conditions (solar loads or parked interior air temperature).<sup>3331</sup> These technologies are listed on a thermal control menu that provides a

---

<sup>3328</sup> See Section V for further details. Notably, manufacturers cannot claim CAFE-related benefits for reducing A/C leakage or switching to an A/C refrigerant with a lower global warming potential. While these improvements reduce GHG emissions consistent with the purpose of the CAA, they generally do not impact fuel economy and, thus, are not relevant to the CAFE program.

<sup>3329</sup> The approach for recognizing potential A/C efficiency gains is to utilize, in most cases, existing vehicle technology/componentry, but with improved energy efficiency of the technology designs and operation. For example, most of the additional A/C-related load on an engine is because of the compressor, which pumps the refrigerant around the system loop. The less the compressor operates, the less load the compressor places on the engine resulting in less fuel consumption and CO<sub>2</sub> emissions. Thus, optimizing compressor operation with cabin demand using more sophisticated sensors, controls, and control strategies is one path to improving the efficiency of the A/C system. For further discussion of A/C efficiency technologies, see Section II.D of the NPRM and Chapter 6 of the accompanying PRIA.

<sup>3330</sup> See 40 CFR 86.1868-12.

<sup>3331</sup> See 40 CFR 86.1869-12(b).

predefined improvement value for each technology. If a vehicle has more than one thermal load improvement technology, the improvement values are added together, but subject to a cap of 3.0 grams/mile for cars and 4.3 grams/mile for trucks.

EPA requested comment on the A/C caps and on whether A/C efficiency technologies and off-cycle thermal control technologies should be combined under a single cap, since the technologies directly interact with each other. That is, improved thermal control results in reduced A/C loads for the more efficient A/C technologies. If the thermal credits were removed from the off-cycle menu, they would no longer be counted against the 10 grams/mile menu cap discussed above, representing a way to provide more room under the menu cap for other off-cycle technologies. Specifically, EPA sought comment on replacing the current off-cycle thermal efficiency capped value of 10 grams/mile, with separate caps of 8 grams/mile for cars and 11.5 grams/mile for trucks.

Comments concerning the A/C caps were received from the Auto Alliance, DENSO, Fiat Chrysler, and Volkswagen. DENSO commented that A/C efficiency credits earned through the off-cycle petition process should not count toward the A/C credit cap. If A/C credits granted through the off-cycle petition process are no longer counted toward the A/C credit cap, it stated that manufacturers would be significantly incentivized to develop new and innovative technologies.<sup>3332</sup> Fiat Chrysler requested that certain A/C credits for electrical technologies (*i.e.*, A/C blower motor controls that limit wasted electrical energy) be transferred to the off-cycle

---

<sup>3332</sup> DENSO, Detailed Comments, NHTSA-2018-0067-11880.

credit list.<sup>3333</sup> Volkswagen further supported the removal of the thermal control technology credit caps and suggested that implementing caps at the fleet average level, rather than per-vehicle, could be less constraining.<sup>3334</sup> DENSO pointed to an NREL study which found that A/C improvements were greater than previously thought possible. Therefore, it requested the agencies consider increasing the A/C credit cap.<sup>3335</sup>

Similarly, the Auto Alliance and Fiat Chrysler suggested raising the cap on A/C efficiency and thermal control technology by 64 percent and combine them under a single cap.<sup>3336</sup> Additionally, they proposed increasing A/C efficiency and thermal control technology credits by up to 64 percent.<sup>3337</sup> They also proposed that the agencies create new regulatory provisions to handle additional new A/C and thermal technologies.<sup>3338</sup>

As with increasing the credit caps, manufacturers and suppliers were generally supportive of higher credit caps, or no caps at all, for this combined technology group. However, EPA has decided not to adopt any changes to the caps, including combining the A/C efficiency and thermal controls menu, due to the uncertainty regarding the menu credit values. Additional uncertainty exists for these technology groups because there are likely synergistic effects between A/C efficiency and thermal technologies that would need to be further considered in determining appropriate credit levels if the two groups of technologies are combined under a single cap. Data is not currently available to consider these effects. Therefore, the agencies are

not making any changes to the flexibilities for A/C efficiency improvements in the CO<sub>2</sub> or CAFE program, but may perform research to understand better the relationship between A/C efficiency and thermal technologies for consideration in future rulemakings.

### 3. Flexibilities for Off-Cycle Technologies

“Off-cycle” technologies are those that reduce vehicle fuel consumption and CO<sub>2</sub> emissions in the real world, but for which the fuel consumption reduction benefits cannot be measured or cannot be fully measured under the 2-cycle test procedures (city, highway or correspondingly FTP, HFET) used to determine compliance with the fleet average standards. The CAFE city and highway test cycles, collectively referred to as the 2-cycle laboratory compliance tests (or 2-cycle tests), were developed in the early 1970s. The city test simulates city driving in the Los Angeles area at that time. The highway test simulates driving on secondary roads (not expressways). The cycles are effective in measuring improvements in most fuel economy improving technologies; however, they are unable to measure or underrepresent certain fuel economy improving technologies because of limitations in the test cycles. For example, off-cycle technologies that improve emissions and fuel economy at idle (such as “stop start” systems) and those technologies that improve fuel economy to the greatest extent at expressway speeds (such as active grille shutters which improve aerodynamics) receive less than their real-world benefits in the 2-cycle compliance tests.

Starting with MY 2008, EPA began employing a “five-cycle” test methodology to measure fuel economy for the purpose of improving new car window stickers (labels) and giving consumers better information about the fuel economy they could expect under real-world driving

conditions.<sup>3339</sup> However, for CO<sub>2</sub> and CAFE compliance, EPA continues to use the established “two-cycle” test methodology.<sup>3340</sup> As learned through development of the “five-cycle” methodology and prior rulemakings, there are technologies that provide real-world CO<sub>2</sub> emissions and fuel consumption improvements, but those improvements are not fully reflected on the “two-cycle” test. EPA established the off-cycle credit program to provide an appropriate level of CO<sub>2</sub> credit for technologies that achieve CO<sub>2</sub> reductions, but are normally not chosen as a CO<sub>2</sub> control strategy because their CO<sub>2</sub> benefits are not measured on the specified 2-cycle test.

Currently, EPA has three compliance pathways. The first approach allows manufacturers to gain credits without having to prove the benefits of the technologies on a case-by-case basis. A predetermined list or “menu” of credit values for specific off-cycle technologies exists and became effective starting in MY 2014.<sup>3341</sup> This pathway allows manufacturers to use credit values established by EPA for a wide range of off-cycle technologies, with minimal or no data submittal or testing requirements.<sup>3342</sup> Specifically, EPA established a menu with a number of technologies that have real-world CO<sub>2</sub> and fuel consumption benefits not measured, or not fully measured, by the two-cycle test procedures, and those benefits were reasonably quantified by the agencies at that time. For each of the pre-approved technologies on the menu, EPA established a quantified default value that is available without additional testing. Manufacturers must

---

<sup>3339</sup> <https://www.epa.gov/vehicle-and-fuel-emissions-testing/dynamometer-drive-schedules>.

<sup>3340</sup> The city and highway test cycles, commonly referred to together as the 2-cycle tests are laboratory compliance tests required by law for CAFE and are also used for determining compliance with the GHG standards.

<sup>3341</sup> See 40 CFR 86.1869-12(b).

<sup>3342</sup> The Technical Support Document (TSD) for the 2012 final rule for MYs 2017 and beyond provides technology examples and guidance with respect to the potential pathways to achieve the desired physical impact of a specific off-cycle technology from the menu and provides the foundation for the analysis justifying the credits provided by the menu. The expectation is that manufacturers will use the information in the TSD to design and implement off-cycle technologies that meet or exceed those expectations in order to achieve the real-world benefits of off-cycle technologies from the menu.

demonstrate that they were in fact using the menu technology, but not required to conduct testing to quantify the technology's effects, unless they wish to receive a credit larger than the default value. The default values for these off-cycle credits were largely determined from research, analysis, and simulations, rather than from full vehicle testing, which would have been both cost and time prohibitive. EPA generally used conservative predefined estimates to avoid any potential credit windfall.<sup>3343</sup>

For off-cycle technologies not on the pre-defined technology list, or obtained through petitioning, EPA created a second pathway which allows manufacturers to use 5-cycle testing to demonstrate and justify off-cycle CO<sub>2</sub> credits.<sup>3344</sup> EPA established this alternative for a manufacturer to demonstrate the benefits of the technology using 5-cycle testing. The additional emissions tests allow emission benefits to be demonstrated over some elements of real-world driving not captured by the CO<sub>2</sub> compliance tests, including high speeds, rapid accelerations, and cold temperatures. Under this pathway, manufacturers submit test data to EPA, and EPA determines whether there is sufficient technical basis to approve the off-cycle credits. No public comment period is required for manufacturers seeking credits using the EPA menu or using 5-cycle testing.

---

<sup>3343</sup> While many of the assumptions made for the analysis were conservative, others were “central.” For example, in some cases, an average vehicle was selected on which the analysis was conducted. In that case, a smaller vehicle may presumably deserve fewer credits whereas a larger vehicle may deserve more. Where the estimates are central, it would be inappropriate for the agencies to grant greater credit for larger vehicles, since this value is already balanced by smaller vehicles in the fleet. The agencies take these matters into consideration when applications are submitted for credits beyond those provided on the menu.

<sup>3344</sup> See 40 CFR 86.1869-12(c). EPA proposed a correction for the 5-cycle pathway in a separate technical amendments rulemaking. See 83 FR 49344 (Oct. 1, 2019). EPA is not approving credits based on the 5-cycle pathway pending the finalization of the technical amendments rule.

The third pathway allows manufacturers to seek EPA approval, through a notice and comment process, to use an alternative methodology other than the menu or 5-cycle methodology for determining the off-cycle technology CO<sub>2</sub> credits.<sup>3345</sup> Manufacturers must provide supporting data on a case-by-case basis demonstrating the benefits of the off-cycle technology on their vehicle models. Manufacturers may also use the third pathway to apply for credits and FCIVs for menu technologies where the manufacturer is able to demonstrate credits and FCIVs greater than those provided by the menu.

Due to the uncertainties associated with combining menu technologies and the fact that some uncertainty is introduced because off-cycle credits are provided based on a general assessment of off-cycle performance, as opposed to testing on the individual vehicle models, EPA established caps that limit the amount of credits a manufacturer may generate using the EPA menu. Off-cycle technology is capped at 10 grams/mile per year on a combined car and truck fleet-wide average basis. No caps were established for technologies gaining credits through the petitioning or 5-cycle approval methodologies.

a) *Consideration of Eliminating A/C and Off-Cycle Adjustments in the CO<sub>2</sub> and CAFE Programs*

The agencies sought comments in the NPRM on whether to remove the A/C and off-cycle flexibilities from the CAFE program and adjust the stringency levels accordingly based upon concern that the flexibilities might distort the market. Several commenters provided responses concerning the feasibility of removing any of these flexibilities. Commenters included

---

<sup>3345</sup> See 40 CFR 86.1869-12(d).

the Auto Alliance, the National Automobile Dealers Association, Global Automakers, the Alliance for Vehicle Efficiency, ACEEE, BorgWarner, Fiat Chrysler, General Motors, International Council on Clean Transportation, Toyota, and UCS. Other comments were received requesting that the agencies look into expanding the flexibilities by including more technologies.

There was widespread support from commenters for retaining these flexibilities for A/C and off-cycle technologies in the CO<sub>2</sub> and CAFE programs. Commenters preferred that the agencies continue to include the flexibilities, believing them to enable real world fuel economy improvements and compliance with CO<sub>2</sub> and CAFE standards with a more cost effective combination of technologies. The agencies agree that these programs achieve real world fuel economy improvements and that keeping the flexibilities may enable more cost effective technology combinations to achieve those real world fuel economy improvements. For MY 2017, manufacturers introduced a wide variety of low-cost technologies through the A/C and off-cycle flexibilities that increased the overall industry's CAFE performance by 1.1 mpg. The agencies also acknowledge that the continued use of these flexibilities under the EPA program since 2012 warrants consideration due to automakers' and suppliers' significant investments in developing the technologies, which could result in stranded capital should the agencies discontinue them and manufacturers choose to remove the technologies. For these reasons, the agencies have decided to continue allowing manufacturers to use the existing flexibilities for A/C efficiency and off-cycle technologies for future model years.

*b) Final Decisions in Response to Manufacturers' and Suppliers' Requests*

Automakers, trade associations, and auto suppliers recommended several changes to the current off-cycle credit program.<sup>3346</sup> Prior to the NPRM, automakers and suppliers suggested changes to the off-cycle program, including:

- Streamlining the program in ways that would give auto manufacturers more certainty and make it easier for manufacturers to earn credits;
- Expanding the current pre-defined off-cycle credit menu to include additional technologies and increasing credit levels where appropriate;
- Eliminating or increasing the credit cap on the pre-defined list of off-cycle technologies and revising the thermal technology credit cap; and
- Creating a role for suppliers directly to seek approval of their technologies.

EPA requested comments on several aspects of the off-cycle credits program and, as discussed below, both EPA and NHTSA are adopting some modest changes, primarily to help streamline and clarify their programs, and to ease the implementation burden for manufacturers and the government. The agencies are not adopting a significant expansion of the programs in this rule, as also discussed below. EPA and NHTSA are taking this relatively conservative approach for their off-cycle programs due to the uncertainty that remains in estimating off-cycle

---

<sup>3346</sup> See generally Alliance/Global Petition.

benefits of technologies and the need to remain cautious to help ensure that emissions and fuel economy benefits expected through the off-cycle flexibility are realized in the real-world.

(1) *Program Streamlining*

EPA requested comments on changes to the off-cycle process that would streamline the program. Currently, under the third pathway, manufacturers submit an application that includes the methodology they used to determine the off-cycle credit value and data, which then undergoes a public notice and comment process prior to an EPA decision regarding the application. Each manufacturer separately submits an application to EPA that must undergo a public notice and comment process even if the manufacturer uses a methodology previously approved by EPA for another manufacturer. For example, under the current program, multiple manufacturers have separately submitted applications for high-efficiency alternators and advanced A/C compressors using similar methodologies and producing similar levels of credits. If manufacturers also seek fuel economy improvement values for the CAFE program, they are also required to send the submissions to NHTSA, as EPA consults with NHTSA in its determinations for the CAFE program. NHTSA's involvement is discussed in more detail in Section IX.D.3.b).

EPA requested comment on revising the regulations to allow all auto manufacturers to make use of a methodology once it has been approved by EPA under the public process, without subsequent applications from other manufacturers having to undergo the same process. This would reduce redundancy in the current program. Manufacturers would need to provide EPA with at least the same level of data and detail for the technology and methodology as the manufacturer that went through the initial public notice and comment process.

EPA received supportive comments for streamlining the approval process from auto manufacturers and suppliers. The Auto Alliance commented that it supports all actions that would shorten the time it takes EPA to evaluate and reach decisions on applications through the off-cycle alternative methodology pathway, and that manufacturers should be allowed to use common data from applications that have already been approved.<sup>3347</sup> Such common data would include ambient conditions, general consumer behavior data, and general operating and performance data for the same off-cycle technologies. Global Automakers also commented that EPA should streamline efforts to avoid reduplication of applications in situations where multiple automakers have submitted petitions for the same technology and recommended blanket approval for applications using the same specific technologies and calculation and measurement procedures.<sup>3348</sup> General Motors commented that when a credit for a new technology is approved for one manufacturer, the EPA decision document announcing that approval can serve as a guidance document that assigns a credit value or calculation methodology for the technology for all manufacturers without requiring duplicative testing.<sup>3349</sup> MEMA commented that it would be sufficient to uphold the integrity of the off-cycle program to require the next vehicle manufacturer's application to provide at least the same level of data and details as the original vehicle manufacturer application and to validate the level of credit the next vehicle manufacturer is applying for based on how the technology is applied in its fleet.<sup>3350</sup>

<sup>3347</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

<sup>3348</sup> Global Automakers, Detailed Comments, NHTSA-2018-0067-12032.

<sup>3349</sup> General Motors, Detailed Comments, NHTSA-2018-0067-11858-21.

<sup>3350</sup> MEMA, EPA-HQ-OAR-2018-0283-5692. *See*

<https://www.mema.org/sites/default/files/resource/MEMA%20CAFE%20and%20GHG%20Vehicle%20Comments%20FINAL%20with%20Appendices%20Oct%2026%202018.pdf>.

ACEEE commented that any streamlining of the process by which automakers petition for off-cycle credits must maintain the requirement that a thorough methodology show real-world benefits and ensure adequate opportunity for public review.<sup>3351</sup> International Council on Clean Transportation (ICCT), while not commenting on this specific request for comment, commented that the program should remain unchanged until potential changes can be further analyzed.<sup>3352</sup>

After considering the comments, consistent with its request for comment, EPA is streamlining the approval process as follows: once a methodology for a specific off-cycle technology has gone through the public notice and comment process and is approved for one manufacturer, other manufacturers may follow the same methodology to collect data on which to base their off-cycle credits. Once a methodology is approved, other manufacturers may submit applications citing the approved methodology, but those manufacturers must provide their own necessary test data, modeling, and calculations of credit value specific to their vehicles, and any other vehicle-specific details pursuant to that methodology, to assess an appropriate credit value. This is similar to what occurred, for example, with the advanced A/C compressor, where one manufacturer applied for credits with data collected through bench testing and vehicle testing and subsequent manufacturers applied for credits following the same methodology, but by submitting test data specific to their vehicle models. However, those subsequent applications previously required a public notice and comment process. For future applications, as long as the testing is conducted using the previously-approved methodology, EPA will evaluate the credit

---

<sup>3351</sup> ACEEE, Detailed Comments, NHTSA-2018-0067-12122.

<sup>3352</sup> International Council on Clean Transportation, Detailed Comments, NHTSA-2018-0067-11741.

application and issue a decision with no additional notice and comment, since the first application that established the methodology was subject to notice and comment.

EPA is not providing blanket approval for a specific credit value, nor amending the requirement that manufacturers collect necessary data or perform modeling or other analyses on their specific vehicle models as the basis for the credit. However, once a methodology has been fully vetted and approved through the public process, EPA believes additional public review of the identical methodology is unnecessarily duplicative. In EPA's experience thus far (for example with high-efficiency alternators and advanced A/C compressors for which EPA has received applications from several manufacturers based on the same methodology), additional public review has yielded no additional substantive public comments. EPA believes this change in the program will help reduce the time necessary for review of applications. EPA will maintain the option to seek additional public comment in cases where the agency believes a new application deviates from a previously approved methodology or raises new issues on which the agency believes it is prudent to seek comment.

EPA also requested comment on revising the regulations to allow EPA to, in effect, add technologies to the pre-approved credit menu without going through a subsequent rulemaking. For example, if one or more manufacturers submit applications with sufficient supporting data for the same or similar technology, the data from that application(s) could potentially be used by EPA as the basis for adding technologies to the menu. EPA requested comment on revising the regulations to allow EPA to establish through a decision document a credit value, or scalable value as appropriate, and technology definitions or other criteria to be used for determining whether a technology qualifies for the new menu credit. As envisioned in the NPRM, this streamlined process of adding a technology to the menu would involve an opportunity for public

review but not a formal rulemaking to revise the regulations, allowing EPA to add technologies to the menu in a timely manner, where EPA believes that sufficient data exist to estimate an appropriate credit level for that technology across the fleet.

EPA received supportive comments regarding this request for comments from auto manufacturers and suppliers who believe that the change would help streamline the program. EPA also received comments from environmental NGOs suggesting that the program should not be changed at this time. After consideration of these comments, the agencies are not revising the regulations to allow technologies to be added to the menu without a rulemaking because EPA believes that menu-based off-cycle credits should be based on a robust demonstration of the technology, consistent with the regulations. The agencies will retain the option to add technologies to the menu through a rulemaking, similar to the approach being taken for high-efficiency alternators and advanced A/C compressors as discussed below, where sufficient data has been collected from multiple manufacturers and vehicle models on which to base a menu credit. The menu credits are meant to be conservative. The agencies are concerned that basing a menu credit on data from only one or a few manufacturers does not guarantee a robust and accurate credit level representing vehicles across the fleet. At this time, the agencies continue to believe a rulemaking process with full opportunity for public comment remains the best approach for adding technologies to the menu. A rulemaking ensures that all stakeholders including automakers have an opportunity to provide data to support an appropriate and conservative credit level for the fleet. This approach also provides an incentive for manufacturers to, in the meantime, continue to perform testing and provide actual data that could eventually be used to inform a rulemaking process to add a technology to the menu. The

agencies want to preserve that element of the program to maintain the integrity of off-cycle credits representing real-world reductions.

(2) *A/C and Off-Cycle Application Process*

The agencies received several comments, in addition to those received in the petitions from the Auto Alliance and Global Automakers, discussed below, on the application process for approving additional A/C and off-cycle credits. Commenters included the Global Automakers, the Auto Alliance, Volkswagen, Edison Electric Institute, Ford, Fiat Chrysler, NCAT, Toyota, General Motors, and DENSO International.

Fiat Chrysler, Ford, Volkswagen, DENSO International, Global Automakers, and the Auto Alliance requested that the agencies respond more quickly to applications for A/C and off-cycle technologies.<sup>3353</sup> They prefer that petitions be addressed before the close of a model year so manufacturers can have a better idea of what credits they will earn.

The agencies agree that responding to petitions before the end of a model year is beneficial to manufacturers and the government. Manufacturers would have a better idea of the approved credits, and the government could carry-out its compliance processes more efficiently. EPA structured the A/C and off-cycle programs to make it possible to complete the processes by the end of the model year so manufacturers could submit their final reports within the required deadline, 90 days after the calendar year. However, delays currently exist due to the timing

---

<sup>3353</sup> Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943-50; Ford, Detailed Comments, NHTSA-2018-0067-11928-15; Volkswagen, Detailed Comments, NHTSA-2017-0069-0583-13; DENSO, Detailed Comments, NHTSA-2018-0067-11880-5; Global Automakers, Detailed Comments, NHTSA-2018-0067-12032-50; Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073-120.

needed to review and approve technologies for the first time and issue *Federal Register* notices seeking public comments, where applicable. The agencies anticipate these problems will resolve themselves as the off-cycle program reaches maturity and EPA initiates the new streamlining approaches adopted in this final rule, discussed in the previous section.

The agencies are also aware that delays exist because manufacturers frequently submit late applications, new applications, and ask for retroactive credits or FCIVs for off-cycle technologies equipped on previously-manufactured vehicles after the model year has ended. As required under both the CO<sub>2</sub> and CAFE programs, manufacturers are to submit applications for off-cycle credits and FCIVs *before* the beginning of each compliance model year, to enable the agencies to make better informed final decisions before the model year ends.

To expedite the process of approvals, the agencies will enforce existing EPA and NHTSA regulations requiring manufacturers to notify and report information on the technologies before the beginning of the model year. Presently, manufacturers must notify EPA in their pre-model year reports, and in their applications for certification, of their intention to generate any A/C and off-cycle credits before the model year, regardless of the methodology for generating credits.<sup>3354</sup> Manufacturers choosing to generate credits using the alternative EPA-approval methodology are required to submit a detailed analytical plan to EPA *prior to a model year* in which a manufacturer intends to seek these credits. The manufacturer may seek EPA input on the proposed methodology prior to conducting testing or analytical work, and EPA will provide input on the manufacturer's analytical plan. The alternative demonstration program must be

---

<sup>3354</sup> See 40 CFR 86.1869(a) and 40 CFR 1843-01.

approved in advance by the Administrator. NHTSA has similar provisions for its projections reports in which detailed information on the technologies must be included in those submissions during the month of December before the model year.<sup>3355</sup> NHTSA's provisions also require manufacturers to submit information to NHTSA at the same time as to EPA. Consequently, the eligibility of a manufacturer to gain off-cycle CO<sub>2</sub> credits or CAFE adjustments for a given compliance model year requires appropriate submissions to the agencies. The agencies intend to enforce these provisions starting with the 2020 compliance model year. Manufacturers may resubmit MY 2020 information until May 1, 2020. After that time, the agencies will deny any manufacturers' late submissions requesting retroactive credits. However, manufacturers who properly submit information ahead of time will be allowed to make corrections to resolve inadvertent errors during or after the model year. The agencies believe that enforcing the existing submission requirements will be the most efficient approach to expedite approvals until new regulatory deadlines or additional requirements can be adopted.

Fiat Chrysler, Volkswagen, Global Automakers, and the Auto Alliance further suggested the EPA issue a *Federal Register* notice for submitted off-cycle applications within 30 days and issue a final decision within 90 days.<sup>3356</sup>

As mentioned, EPA is addressing the issues raised by commenters by streamlining its required regulatory processes to eliminate the need to submit multiple *Federal Register* notices concerning requests from different manufacturers for the same technology. Under this

---

<sup>3355</sup> See 49 CFR Part 537.7(c)(7) and 49 CFR Part 531.6 and 533.6.

<sup>3356</sup> Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943; Volkswagen, Detailed Comments, NHTSA-2017-0069-0583; Global Automakers, Detailed Comments, NHTSA-2018-0067-12032; Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

streamlined process, after a technology is approved for the initial manufacturer(s), EPA will approve any subsequent manufacturer requests for the same technology upon receipt of data submissions validating the benefit specific to their model types.

General Motors, Toyota, NCAT, Fiat Chrysler, Ford, Volkswagen, DENSO, Edison Electric Institute, Global Automakers, and the Auto Alliance further suggested that technologies approved for multiple manufacturers, to the extent additional automakers will have the same requests, be added to the menu to encourage additional implementation of the technology. Doing so would reduce duplicative efforts for the agencies, as well as manufacturers.<sup>3357</sup>

As mentioned previously, the agencies have decided to allow only new technologies to be added to the menu through the regular rulemaking processes including the opportunity for notice and public comment.

General Motors, DENSO, Global Automakers, and the Auto Alliance further suggested that suppliers should be allowed to request a “grams per mile” value for their off-cycle technologies. They asserted that this will provide certainty to manufacturers before they buy that technology.<sup>3358</sup> Toyota and the Auto Alliance suggested that the agencies could improve efficiency and reduce burdens by creating a “toolbox,” methodologies that manufacturers can

---

<sup>3357</sup> General Motors, Detailed Comments, NHTSA-2018-0067-11858; Toyota, Detailed Comments, NHTSA-2018-0067-12150; NCAT, Detailed Comments, NHTSA-2018-0067-11969; Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943; Ford, Detailed Comments, NHTSA-2018-0067-11928; Volkswagen, Detailed Comments, NHTSA-2017-0069-0583; DENSO, Detailed Comments, NHTSA-2018-0067-11880; Edison Electric Institute, Detailed Comments, NHTSA-2018-0067-11918; Global Automakers, Detailed Comments, NHTSA-2018-0067-12032; Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

<sup>3358</sup> General Motors, Detailed Comments, NHTSA-2018-0067-11858; DENSO, Detailed Comments, NHTSA-2018-0067-11880; Global Automakers, Detailed Comments, NHTSA-2018-0067-12032; Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

apply to the analysis of off-cycle credit opportunities.<sup>3359</sup> They stated it would additionally help manufacturers if the agency would issue guidance letters and decision documents for off-cycle credit approvals.<sup>3360</sup>

The agencies believe that developing a “toolbox” may not be possible due to the development of new and emerging technologies, and manufacturers’ different approaches for evaluating the benefits of the technologies. The agencies may consider additional guidance, if feasible, as the programs further matures in the approval process of technologies and if the agencies can identify consistent methodologies that may help manufacturers analyze off-cycle technologies.

NCAT and General Motors requested more transparency in the A/C and off-cycle approval process. They suggested that the agencies could provide reports including off-cycle credits approved by vehicle make and model and provide further clarification of data requirements that influenced the decision process.<sup>3361</sup>

EPA and NHTSA have separate approaches for sharing information on these flexibilities, to provide public transparency. EPA already provides detailed information on manufacturers generation of A/C and off-cycle credits for each model year in its end of the year compliance report, including the magnitude of credits by manufacturer and by credit type, the credits generated by technology type, and the penetration of off-cycle technologies in each

manufacturer's fleet.<sup>3362</sup> NHTSA plans to share similar information on its PIC and to provide projected data on the market penetration rates of the technologies as soon as it starts receiving information through its new reporting templates for the 2023 compliance model year.

(3) *High Efficiency Alternators and Advanced Air  
Conditioning (A/C) Compressors*

EPA sought comments on modifying the off-cycle menu to add certain technologies for which EPA has collected sufficient data to set an appropriate credit level. More specifically, EPA received data from multiple manufacturers on high-efficiency alternators and advanced air conditioning (A/C) compressors that could serve as the basis for new menu credits for these technologies.<sup>3363</sup> EPA requested comments on adding these two technologies to the menu including comments on credit level and appropriate definitions. EPA also requested comments on other off-cycle technologies that EPA could consider adding to the menu including supporting data that could serve as the basis for the credit.

EPA received only supportive comments on its specific request for comments regarding adding high efficiency alternators and advanced A/C compressors to the menu. Toyota, General Motors, BorgWarner, Fiat Chrysler, the Auto Alliance, Global Automakers, MECA, DENSO, SAFE, and Volkswagen submitted responses on the off-cycle menu. General Motors, Volkswagen, Fiat Chrysler, Global Automakers, and the Auto Alliance all supported adding

---

<sup>3362</sup> “The 2018 EPA Automotive Trends Report: Greenhouse Gas Emissions, Fuel Economy, and Technology since 1975,” EPA-420-R-19-002. March 2019; Figures 5.8 through 5.12, and Tables 5.3 and 5.4.

<sup>3363</sup> <https://www.epa.gov/vehicle-and-engine-certification/compliance-information-light-duty-greenhouse-gas-ghg-standards>.

high-efficiency alternators and advanced A/C compressors to the menu.<sup>3364</sup> They commented that these technologies have already been approved for off-cycle credits through the petition process multiple times. They contend that it would be less burdensome if the technologies would be added to the pre-approved off-cycle credit list. That said, they were concerned about being constrained by the off-cycle caps.<sup>3365</sup>

The agencies believe that adding high-efficiency alternators and advanced A/C compressors to the menu is a reasonable step to help streamline the program by allowing manufacturers to select the menu credit rather than continuing to seek credits through the public approval process. Therefore, EPA is revising the regulations to add these two technologies to the menus. The high-efficiency alternator is being added to the off-cycle credits menu, and the advanced A/C compressor with a variable crankcase valve is being added to the menu for A/C efficiency credits. The credit levels are based on data previously submitted by multiple manufacturers through the off-cycle credits application process, and discussed in the NPRM. The high efficiency alternator credit is scalable with efficiency, providing an increasing credit value of 0.16 grams/mile CO<sub>2</sub> per percent improvement as the efficiency of the alternator increases above a baseline level of 67 percent efficiency. The advanced A/C compressor credit value is 1.1 grams/mile for both cars and light trucks.<sup>3366</sup>

---

<sup>3364</sup> General Motors, Detailed Comments, NHTSA-2018-0067-11858; Volkswagen, Detailed Comments, NHTSA-2017-0069-0583; Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943; Global Automakers, Detailed Comments, NHTSA-2018-0067-12032; Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

<sup>3365</sup> See, e.g., General Motors, Detailed Comments, NHTSA-2018-0067-11858.

<sup>3366</sup> For additional details regarding the derivation of these credits see EPA's Memorandum to Docket EPA-HQ-OAR-2018-0283 ("Potential Off-cycle Menu Credit Levels and Definitions for High Efficiency Alternators and Advanced Air Conditioning Compressors").

EPA also received comments from the Auto Alliance, Fiat Chrysler, General Motors, Mitsubishi, Gentherm, ITB, and MEMA on a variety of individual technologies that they suggest adding to the menu.<sup>3367</sup> These commenters provided little data to support their recommended credit levels. The Auto Alliance and Alliance for Vehicle Efficiency further asserted that flexibility mechanisms are increasingly important and there is a need to develop unconventional and non-traditional fuel economy technologies to meet standards.<sup>3368</sup> They requested additional pre-defined and pre-approved technologies to be included in this regulation.<sup>3369</sup>

The agencies have reviewed manufacturers' requests for adding additional technologies to the picklist and concluded that there is insufficient data in the record at this time on which to base an appropriate menu credit value for the technologies. Therefore, none of these technologies are being added to the menu at this time. Given the limited data and uncertainty, EPA also does not believe it would be appropriate to add any of the technologies to the menu without an opportunity for public review and comment. Although the agencies are not adding these technologies to the menu at this time, manufacturers may seek off-cycle credits for these technologies through the other program pathways.

(4) *Stop-Start Technology*

In 2014, EPA approved additional credits for the Mercedes-Benz's stop-start system through the off-cycle credit process based on data submitted by Mercedes-Benz on fleet idle time and its system's real-world effectiveness (i.e., how much of the time the system turns off the engine when the vehicle is stopped).<sup>3370</sup> Prior to proposal, multiple auto manufacturers requested that EPA revise the table menu value for stop-start technology based solely on one input value EPA considered, idle time, in the context of the Mercedes-Benz stop-start system. No manufacturers provided additional data on any of the other factors evaluated during consideration of a conservative credit value for stop-start systems. Stop-start systems vary significantly in hardware, design, and calibration, leading to wide variations in the amount of idle time during which the engine is actually turned off in real-world driving. EPA has learned that some stop-start systems may be less effective in the real-world than the agency estimated in its 2012 rulemaking analysis, for example, due to systems having a disable switch available to the driver, or because stop-start systems can be disabled under certain temperature conditions or auxiliary loads, which would offset the benefits of the higher idle time estimates. EPA requested additional data from manufacturers, suppliers, and other stakeholders regarding a comprehensive update to the stop-start off-cycle credit table value. EPA did not receive any additional real-world system effectiveness data from commenters on which to base an adjusted credit level. MEMA commented that EPA should base an increase in the credit on the agencies' updated estimated effectiveness of stop-start technology in the Draft Technical Assessment Report

---

<sup>3370</sup> "EPA Decision Document: Mercedes-Benz Off-cycle Credits for MY 2012-2016," EPA-420-R-14-025 (Sept. 2014).

(TAR), which shows a 67 percent increase in effectiveness.<sup>3371, 3372</sup> However, EPA notes that this estimate is for system effectiveness over the 2-cycle test procedures and, therefore, is not an appropriate basis to adjust the off-cycle credits. The agencies are not adjusting the menu credits for stop-start systems at this time. Manufacturers may apply for additional credits if they are able to collect data demonstrating a system effectiveness that would serve as the basis for those credits.

(5) *Menu Credit Cap*

The off-cycle menu currently includes a fleetwide cap on credits of 10 grams/mile to address the uncertainty surrounding the data and analysis used as the basis of the menu credits.<sup>3373</sup> Prior to proposal, some stakeholders expressed concern that the current cap may constrain manufacturers' future ability to fully utilize the menu especially if the menu is expanded to include additional technologies, as described above. For example, Global Automakers suggested raising the cap from 10 grams/mile to 15 grams/mile.<sup>3374</sup> EPA requested comments on increasing the current cap, for example, from the current 10 grams/mile to 15 grams/mile to accommodate increased use of the menu. EPA also requested comment on a concept that would replace the current menu cap with an individual manufacturer cap that would scale with the manufacturer's average fleetwide target levels. The cap would be based on a

---

<sup>3372</sup> MEMA, EPA-HQ-OAR-2018-0283-5692. *See* <https://www.mema.org/sites/default/files/resource/MEMA%20CAFE%20and%20GHG%20Vehicle%20Comments%20FINAL%20with%20Appendices%20Oct%2026%202018.pdf>.

<sup>3373</sup> 40 CFR 86.1869–12(b)(2).

<sup>3374</sup> Global Automakers, Detailed Comments, NHTSA-2018-0067-12032.

percentage of the manufacturer's fleetwide 2-cycle emissions performance, for example at five to ten percent of CO<sub>2</sub> of a manufacturer's emissions fleet-wide target. With a cap of five percent for a manufacturer with a 2-cycle fleetwide average CO<sub>2</sub> level of 200 grams/mile, for example, the cap would be 10 grams/mile.

There was widespread support from automakers and suppliers for removing the cap entirely or raising the cap from 10 grams/mile to 15-20 grams/mile. Toyota, General Motors, BorgWarner, Fiat Chrysler, the Auto Alliance, Global Automakers, MECA, DENSO, SAFE, and Volkswagen submitted responses on the off-cycle cap to EPA.<sup>3375</sup> They argued that the 2-cycle test does not always account for all the benefits a technology provides.<sup>3376</sup> General Motors, Fiat Chrysler, the Auto Alliance, Global Automakers, and Volkswagen agreed that EPA should remove the 10 grams/mile cap and, if they must keep the cap, increasing it to 15 grams/mile.<sup>3377</sup>

Global Automakers commented that, as more technology receives off-cycle credit values, the cap will restrict innovation and therefore EPA should lift the cap now in anticipation of increased use of technologies.<sup>3378</sup> General Motors similarly commented that the cap was an arbitrary limit without any technical justification and that, if the agency was to add emission reduction technologies to the menu these devices could not be effectively incentivized if the 10

<sup>3378</sup> Global Automakers, Detailed Comments, NHTSA-2018-0067-12032.

grams/mile cap remains in place, since there would be no room under the cap.<sup>3379</sup> General Motors suggested that as the program continues, manufacturers will continue to find new technologies and will be limited by the cap. They stated that the cap will stifle additional investments for technologies. MEMA commented that if EPA expands the off-cycle technologies menu and continually adds off-cycle technologies to the menu, it is critical that EPA increase or eliminate the cap on the credits gained from the off-cycle menu.<sup>3380</sup>

The Auto Alliance argued that putting caps on emerging new technologies will hinder further vehicle investments and improvements. The planning cycle is implemented years out and without a guarantee they will see benefits, the Auto Alliance stated that manufacturers lack incentivization to work toward large technological advances.<sup>3381</sup> The Auto Alliance and Alliance for Vehicle Efficiency further asserted that flexibility mechanisms are increasingly important and there is a need to develop unconventional and non-traditional fuel economy technologies.<sup>3382</sup>

ACEEE commented that the off-cycle credit menu cap should not be increased or modified without the agency first defining any other changes it might consider making to the off-cycle credit program and this should be done through a separate NPRM and public review process.<sup>3383</sup> ICCT commented that if the agencies allow more use of off-cycle credits without

<sup>3383</sup> ACEEE, Detailed Comments, NHTSA-2018-0067-12122.

clear validation of their real-world benefits, the regulations cannot serve their intended objectives to reduce CO<sub>2</sub> and fuel use.<sup>3384</sup>

EPA also received a few comments warning about the risks of removing the caps and over incentivizing the CAFE and CO<sub>2</sub> programs. ACEEE pointed out that while expanding and updating the flexibilities that incentivize innovation and research is a great method to increase fuel efficiency, it is important to put a time limit on those incentives and carefully design them so manufacturers do not take advantage. ACEEE argued that, if these flexibilities are not implemented thoughtfully, they can end up reducing the program benefits. UCS commented that, given the potential interaction from multiple incentives, it is important to consider the combined impacts of flexibilities on the overall stringency of the regulation. UCS stated that given the potential for widespread harm, credits within the program should be severely limited, and the agencies' assessment of the impacts of such incentives should be extremely conservative in order to promote increased environmental benefits of the fuel economy and carbon dioxide emissions standards.<sup>3385</sup>

The agencies are not increasing the 10 grams/mile menu credit cap at this time. EPA established the 10 grams/mile credit cap to address the uncertainty surrounding the data and analysis used as the basis of the menu credits, and agrees with ACEEE, ICCT, and UCS that sufficient uncertainty remains such that increasing the current cap is not justified. As noted in the 2012 final rule, EPA included the fleet-wide cap because the default credit values were based

---

<sup>3384</sup> ICCT, Detailed Comments, NHTSA-2018-0067-11741-43.

<sup>3385</sup> UCS, Detailed Comments, NHTSA-2018-0067-12039.

on limited data, and also because the agencies recognized that some uncertainty is introduced when credits are provided based on a general assessment of off-cycle performance as opposed to testing on the individual vehicle models.<sup>3386</sup> That uncertainty has not significantly diminished since the 2012 final rule. Also, over the course of implementing the program, EPA has encountered issues with the regulatory definitions currently in place for some technologies. The regulations specify that manufacturers may claim credits for technologies that meet the regulatory definitions. However, there have been instances where manufacturers have claimed credits for a technological approach that they have argued meets the regulatory definition, but EPA found that the technology was not implemented consistent with the technological approach envisioned when the off-cycle program was established. This has raised questions of whether the credits for the technological approach in question truly represent real-world reductions, and whether the credits should ultimately be allowed. These types of issues have resulted in uncertainty, which can lead to delays in credit calculations, competitive inequities, as well as increased burden on the agency to review and resolve issues. The caps continue to serve as an important measure against the loss of emissions reductions and fuel savings given the uncertainty in the credit values as the program is implemented. Since the agencies are not expanding the menu beyond the two technologies discussed above, the agencies believe there remains enough room under the cap such that the menu may continue to serve its purpose as a source of off-cycle credits. Although a few manufacturers approached the cap limit in MY 2018, the fleet average menu credit was 4.7 grams/mile, less than half the cap value.<sup>3387</sup> If the agencies undertake a

---

<sup>3386</sup> 77 FR 62834 (Oct. 15, 2012).

<sup>3387</sup> The 2018 EPA Automotive Trends Report, Greenhouse Gas Emissions, Fuel Economy, and Technology since 1975, EPA-420-R-19-002 (Mar. 2019).

rulemaking in the future to modify the menu or regulatory definitions, the agencies may re-evaluate the cap levels at that time. The agencies note that the cap only applies to credits based on the menu. Under the current program, manufacturers may apply for credits beyond the cap through other available pathways based on a demonstration of off-cycle technology emission reduction data for their fleets.

As noted above, the agencies have decided to continue the option to add technologies to the menu only through the rulemaking process and, for this final rule, have decided to add two new menu items; one for high-efficiency alternators and another for advanced A/C compressors. The agencies stated that they will only add technologies when sufficient data has been collected from multiple manufacturers and vehicle models on which to base a menu credit. Accordingly, the agencies believe this approach ensures that conservative, robust and accurate credit levels are being added representing vehicles “on average” across the fleet.

Finally, NHTSA has been studying how the combination of flexibilities and incentives may adversely affect the stringency of the CAFE regulations. NHTSA is aware of an instance in which combining incentives for alternative fueled vehicles and adjustments for A/C and off-cycle technologies allowed one manufacturer to increase in CAFE fleet performance to a combined average of 516.8 mpg for MY 2017, a curious result. NHTSA is continuing to evaluate the issue of combining incentives and flexibilities and may address this issue further in the future.

#### *(6) Eligibility*

Though, in the NPRM, EPA did not explicitly request comment on the eligibility criteria for determining what technologies are eligible for off-cycle credits, EPA received comments on

this topic. UCS commented that regulations should be clarified so that the program does not result in unwarranted credits for baseline technologies, noting that in the 2012 final rule EPA stated that technologies integral or inherent to the basic vehicle design were not eligible for credits and specifically excluded technologies identified by the agency as technologies a manufacturer may use to meet the two-cycle CO<sub>2</sub> standards.<sup>3388</sup> ACEEE commented that off-cycle credits should be limited to new and innovative technologies and, that to be eligible for credit, a technology must reduce emissions from the vehicle receiving the credit (as opposed to other vehicles on the road, for example, through system effects of technologies designed for crash avoidance or improving traffic flow).<sup>3389</sup> The Auto Alliance also commented in the area of eligibility, suggesting regulatory changes that would allow off-cycle credits for any technology where the manufacturer could demonstrate an off-cycle emissions benefit.<sup>3390</sup> The Auto Alliance commented that the program is intended to provide credit for technologies that provide more fuel economy and CO<sub>2</sub> emissions reduction benefit in the real-world than is realized in FTP and HFET on-cycle testing and that a baseline technology should be eligible for such credits.

Given the various public comments on eligibility of technologies for off-cycle credits, the agencies are clarifying the regulations regarding technology eligibility, consistent with the intent and EPA's interpretation of the 2012 rule, as expressed in the preamble to the proposed and final rules. The agencies believe that clarifying the regulations will reduce confusion among manufacturers as to what technologies are eligible and reduce the overall program burden

---

<sup>3388</sup> UCS, Detailed Comments, NHTSA-2018-0067-12039.

<sup>3389</sup> ACEEE, Detailed Comments, NHTSA-2018-0067-12122.

<sup>3390</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

associated with EPA staff giving continued guidance to manufacturers regarding eligibility, as detailed in the 2012 rule preamble. Eligibility was thoroughly addressed in the 2012 final rule preamble, but the regulations were not as clear, which has led to confusion on the part of some manufacturers and delays in reviewing credit applications.<sup>3391</sup> The agencies are not establishing a new policy regarding eligibility, only amending the language reflecting the existing policy in the regulations for sake of clarity.

As noted in the 2012 final rule preamble, the goal of the off-cycle credits program is to provide “an incentive for the development and use of additional technologies to achieve real-world reductions in CO<sub>2</sub> emissions.”<sup>3392</sup> EPA further stated that the intent of the program is to “provide an incentive for CO<sub>2</sub> and fuel consumption reducing off-cycle technologies that would otherwise not be developed because they do not offer a significant 2-cycle benefit.”<sup>3393</sup> The regulation at 40 CFR 86.1869-12(a) provides that manufacturers may generate credits for CO<sub>2</sub> reducing technologies “where the CO<sub>2</sub> reduction benefit for the technology is not adequately captured on the Federal Test Procedure and/or Highway Fuel Economy Test.” The regulation continues: “[t]hese technologies must have a measurable, demonstrable, and verifiable real-world CO<sub>2</sub> reduction that occurs outside the conditions of the Federal Test Procedure and the Highway Fuel Economy Test.”

Off-cycle credits are available for technologies that are not utilized when performing FTP and HFET tests because their operation is linked to a condition not found during the 2-cycle

---

<sup>3391</sup> 77 FR 62726-36, 62835-37.

<sup>3392</sup> 77 FR 62833.

<sup>3393</sup> 77 FR 62836.

testing. For example, heating and cooling systems are not operated during the 2-cycle test, and therefore, efficiency improvements to these systems are not captured at all on the 2-cycle tests. As the 2012 rule’s language indicates, off-cycle credits are not necessarily limited to technologies listed on the menu or off-cycle technologies with no measurable benefit on the FTP and/or HFET. Off-cycle credits may be available for some technologies whose performance is measurable to some extent on the FTP and/or HFET but which perform measurably better off-cycle. Active aerodynamic and stop-start technologies (menu item) are examples. However, there are limits on what the agencies would consider to be an off-cycle technology eligible for credits, as discussed below.

Just as the regulations and preamble to the 2012 final rule listed technologies that the agencies considered to be off-cycle technologies, the preamble also discussed technologies that the agency would not consider off-cycle technologies—i.e., technologies the agencies consider to be “adequately captured” by the FTP and therefore not eligible for off-cycle credits. The preamble specifically noted that engine, transmission, mass reduction, passive aerodynamic design, and base tire technologies are not considered to be off-cycle technologies eligible for credits.<sup>3394</sup> These are technologies that are considered to be “integral or inherent to basic vehicle design.”<sup>3395</sup> In response to comments in the final rule, the agencies further clarified that advanced combustion concepts, such as camless engines, variable compression ratio engines, micro air/hydraulic launch assist devices, would not be considered to be eligible for credits.<sup>3396</sup> This limitation to eligibility further extends to other engine designs, transmission designs, and

---

<sup>3394</sup> 77 FR 62732, 62836.

<sup>3395</sup> 77 FR 62732, 62836/1; 81 FR 73499.

<sup>3396</sup> 77 FR 62732.

electrification systems not specifically contemplated in the rulemaking, such as Atkinson combustion engines, and 9 and 10 speed transmissions, as well as to other hybrid systems such as 48 Volt technologies. Further, the 2012 final rule preamble stated that technologies included in the agencies' assessment for purposes of developing the standard would not be allowed to generate off-cycle credits and cites the technologies described in Chapter 3 of the 2012 final rule TSD.<sup>3397</sup> Finally, off-cycle credits are not available for technologies required to be used by Federal Law or for crash avoidance systems, safety critical systems, or technologies that may reduce the frequency of vehicle crashes.<sup>3398</sup>

The preamble to the 2012 final rule provides the rationale for what the agency considers an off-cycle technology and, therefore, eligible for credits. Technologies that are integral or inherent to the vehicle are, by necessity, well represented on the 2-cycle test.<sup>3399</sup> Examples provided in the preamble are engine, transmission, mass reduction, passive aerodynamic design, and base tire technologies. The control logic for these powertrain components, like the components themselves (i.e. engine and transmission), are constantly active, fully functioning, and operating over the entirety of the FTP and HFET. Similarly, an automatic transmission, regardless of whether it has 6-speeds or 8-speeds, would still be constantly active, fully functioning and operating over the entirety of the FTP and HFET.<sup>3400</sup> This would also be true for base engine technologies, advanced combustion concepts, engine components (pistons, valves,

---

<sup>3397</sup> 77 FR 62836.

<sup>3398</sup> 40 CFR 86.1869-12(a); 77 FR 62836.

<sup>3399</sup> 77 FR 62732, 62836.

<sup>3400</sup> 76 FR 75024 (Dec. 1, 2011).

camshafts, crankshafts, oil pumps, etc.), and driveline components (individual components of the transmission, axle, and differential).<sup>3401</sup>

Further, even if these technologies have greater benefits on supplemental test cycles, EPA has explained that it would be difficult to devise accurate A/B testing (i.e., with and without the technology) for these technologies.<sup>3402</sup> The 2012 preamble states that “EPA is limiting the off-cycle program to technologies that can be identified as add-on technologies conducive to A/B testing,” partly because it would be very difficult accurately to parse out the off-cycle benefits for some integral technologies.<sup>3403</sup> Because the technology is integral to the vehicle, there would not be an appropriate baseline (i.e., without the technology) vehicle to use for comparison. Vehicles are not built without tires, engines, passive aerodynamics or transmissions.

Also, because these technologies are inherent to the vehicle design, their performance is already reflected in the stringency of the standard and giving credits for these inherent technologies would be a type of double-counting windfall.<sup>3404</sup> “[S]ince these methods are integral to basic vehicle design, there are fundamental issues as to whether they would ever warrant off-cycle credits. Being integral, there is no need to provide an incentive for their use, and (more importantly), these technologies would be incorporated regardless. Granting credits would be a windfall.”<sup>3405</sup> As such, EPA has laid out a clear basis that technological

improvements to integral and inherent components are considered to be adequately captured on the FTP and HFET test.

EPA is clarifying the regulations in a manner that is consistent with the intent and our interpretation of the 2012 rule, as expressed in the preambles to the proposed and final rules. The regulations are revised to specify that technologies used primarily to meet the 2-cycle standards are not eligible for off-cycle credits and that only technologies primarily installed for reducing off-cycle emissions would be eligible. The revised regulations specify that the technologies must not be integral or inherent to the basic vehicle design, such as, for example, engine, transmission, mass reduction, passive aerodynamic design, and tire technologies. Exceptions to these general provisions include technologies already specified on the menu, including engine idle stop-start, active aerodynamic improvements, and high-efficiency alternators. These technologies may provide some benefit on the 2-cycle test, but EPA determined in the 2012 rule that they are eligible for off-cycle credits because they are technologies that could be added to vehicles to provide discernable off-cycle reductions.

Regulatory text at 40 CFR 86.1869–12(a) states: “Manufacturers may generate credits for CO<sub>2</sub> reducing technologies where the CO<sub>2</sub> reduction benefit of the technology is not adequately captured on the Federal Test Procedure and/or the Highway Fuel Economy Test,” to which EPA is adding, “such that the technology would not be otherwise installed for purposes of reducing emissions (directly or indirectly) over those test cycles (i.e., on-cycle) for compliance with the [CO<sub>2</sub>] standards.” EPA is also adding text to this paragraph of the regulations specifying: “The technologies must not be integral or inherent to the basic vehicle design, such as engine, transmission, mass reduction, passive aerodynamic design, and tire technologies. Technologies installed for non-off-cycle emissions related reasons are also not eligible as they would be

considered part of the baseline vehicle design. The technology must not be inherent to the design of occupant comfort and entertainment features except for technologies related to reducing passenger A/C demand and improving A/C system efficiency. Notwithstanding the provisions of this paragraph (a), off-cycle menu technologies included in paragraph (b) of this section remain eligible for credits.”

The agencies believe the above regulatory changes will help reduce confusion over what technologies are eligible for off-cycle credits, refocusing the program on technologies that manufacturers would install on vehicles for purposes of reducing off-cycle emissions rather than obtaining additional credits for technologies installed primarily for 2-cycle emissions reduction or for other reasons not related to emissions. This approach is consistent with the intent of the program as stated in the 2012 final rule to provide an incentive to develop and employ off-cycle technologies not adequately captured on the 2-cycle test procedure.

Of the technologies recommended by manufacturers to be added to the menu, cooled EGR is an example of a technology that would not be eligible because it is an integral 2-cycle technology that EPA noted in its technology assessment in the MY 2012 rule. Cooled EGR is often an integral component of turbo charged gasoline direct injection engines which is a primary CO<sub>2</sub> reduction strategy used by manufacturers to reduce 2-cycle emissions. The technologies are calibrated to act as a system such that is not possible to separate them in a way that would allow for a clear indication of the off-cycle benefit of cooled EGR as a stand-alone technology.

EPA also received comments from the Auto Alliance regarding several technologies they believe should qualify as active warm-up off-cycle technologies. The Auto Alliance commented that systems that use waste heat from the exhaust gas stream should receive additional credits

beyond the menu credits currently established for active engine and transmission warm-up.<sup>3406</sup> However, when EPA established the menu credits for active transmission and engine warm-up in the 2012 rule, EPA envisioned waste heat from the exhaust as the primary source of heat to quickly bring the system to operating temperature as the basis for the warm-up technology credits.<sup>3407</sup> Therefore, EPA does not believe additional credits, as suggested by the Auto Alliance, are warranted. EPA further notes that the definitions for active engine and transmission warm-up specify that “waste heat” be used in active warm-up technologies in order to qualify for the credits.<sup>3408</sup> If a system first directs heat to warm the engine oil or warm the interior cabin, and only then to the engine or transmission, thereby delaying active warm-up, EPA would not view that heat as waste heat since it is serving other purposes during initial vehicle warm-up. EPA would also not consider this approach to be warming up the engine or transmission “quickly” due to the potentially significant delay in warm-up activation. In developing the active warm-up credits, EPA focused on systems using heat from the exhaust as a primary source of waste heat because that heat would be available quickly and also be exhausted by the vehicle and otherwise unused.

EPA allowed for the possible use of other sources of heat such as coolant as the basis for credits as long as those methods would “provide similar performance” as extracting the heat directly from the exhaust system.<sup>3409</sup> However, EPA may require manufacturers to demonstrate

---

<sup>3406</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

<sup>3407</sup> See Joint Technical Support Document: Final Rulemaking for 2017-2025 Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards, EPA-420-R-12-901, August 2012, p. 5-96 - 5-100.

<sup>3408</sup> 40 CFR 86.1869–12(b)(4)(v) and (vi).

<sup>3409</sup> See Joint Technical Support Document: Final Rulemaking for 2017-2025 Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards, p. 5-99, EPA-420-R-12-901, August 2012.

that the system is based on “waste heat” or heat that is not being preferentially used by the engine or other systems to warm-up other areas like engine oil or the interior cabin. Systems using waste heat from the coolant do not qualify for credits if their operation depends on, and is delayed by, engine oil temperature or interior cabin temperature. As the engine and transmission components are warming up, the engine coolant and transmission oil do not have any ‘waste’ heat available for warming up anything else on the vehicle. During engine and transmission warm-up, the only waste heat source in a vehicle with an internal combustion engine is the engine exhaust as the transmission and coolant have not reached warmed-up operating temperature and therefore do not have any heat to share. Conserving heat in a transmission is not a rapid transmission warm-up using waste heat. Unless the component with lubricating oil and coolant is operating at its fully warmed-up design temperature, by EPA’s definition, that component does not have any waste heat available for transfer from the lubricating oil or coolant to any other device until it has reached its fully warmed-up operating temperature (i.e. the temperature when the cooling system is enabled). A qualifying system may involve a second cooling loop that operates independent of the primary coolant system and is not dependent on or otherwise delayed by, for example, cabin temperature. Evaluating whether such systems qualify for menu credits often requires additional information regarding system design to understand better how the system uses waste heat. Given the complexity of these systems and the need to sometimes consider the details of how a system operates, EPA is not making any changes to the menu regarding warm-up technologies.

The Auto Alliance further commented that active transmission bypass valves should qualify for active transmission warm-up credits.<sup>3410</sup> The Auto Alliance commented that traditional transmission oil coolers are always active and sized for extreme or worst-case hot ambient conditions. The coolers will, in colder ambient conditions, keep the transmission temperatures well outside of their most efficient operating range. The bypass valve circumvents the cooler when the transmission is relatively cold preserving the transmission heat, so the transmission warms more quickly. EPA disagrees that this type of approach should be eligible for active transmission warm-up because it does not use waste heat to add heat to the transmission. Instead, it prevents useful heat already present in the transmission from being unnecessarily removed. Also, EPA does not view this type of bypass valve as an off-cycle technology but rather as part of a good engineering design of a transmission cooler system. Many vehicles already are designed with transmission cooler bypass valves. EPA does not believe existing coolers qualify as warm-up technologies simply because they are disabled under cold conditions. This approach does not represent the addition of a new off-cycle warm-up technology but the disabling of an existing cooling technology.

Although the agencies did not consider changes to the program to allow credits for safety-related technologies and autonomous vehicle technologies in the proposal, comments were received both in favor of and not in favor of allowing such credits.<sup>3411</sup> The agencies note that the rationale for not allowing off-cycle credits for safety-related or crash avoidance

---

<sup>3410</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

<sup>3411</sup> See, e.g., SAFE, Detailed Comments, NHTSA-2018-0067-11981; AAA, Detailed Comments, NHTSA-2018-0067-11979.

technologies has not changed since the 2012 rule and, therefore, in the proposed rule the agencies did not consider making any changes to allow off-cycle credits for safety-related technologies.<sup>3412</sup> The agencies continue to believe that there is a very significant distinction between technologies providing direct and reliably quantifiable improvements to fuel economy and CO<sub>2</sub> emission reductions, and technologies which provide those improvements by indirect means, where the improvement is not reliably quantifiable, and may be speculative (or in many instances, non-existent), or may provide benefit to other vehicles on the road more than for themselves. The agencies also continue to believe that the advancement of crash-related and crash avoidance systems specifically is best left to NHTSA's exercise of its vehicle safety authority.

Auto manufacturers and suppliers also commented that EPA should adopt "eco-innovation" credits approved in the European Union (EU) vehicle CO<sub>2</sub> reduction program as part of the off-cycle credits program.<sup>3413</sup> No data was provided as to why the credits would be appropriate for the U.S. vehicle fleet. EPA did not consider or request comment on the EU credits program and does not believe the credit levels would necessarily be appropriate for the U.S. fleet given the very different vehicle use and driving patterns between Europe and the U.S. Thus, there is no assurance that the credits would be based on real-world emissions reductions.

EPA received comments from the Auto Alliance and Global Automakers that EPA should automatically award credits if the agency does not take final action within 90 days of

---

<sup>3412</sup> 77 FR 62733.

<sup>3413</sup> See, e.g., Mitsubishi, Detailed Comments, NHTSA-2018-0067-12056.

receiving a request for credits.<sup>3414</sup> Regarding these comments, EPA does not believe such a provision is in keeping with maintaining the integrity of the off-cycle credits program. As discussed above, EPA often requires time to sort through complex issues to determine if the technologies meet the regulatory requirements for receiving credits and whether the credits have been quantified appropriately. In some instances, EPA has received public comments and manufacturer rebuttals to those comments that takes additional time to consider before making a final decision. EPA's goal continues to be to evaluate applications for credits in as timely a manner as is possible given the issues that must be addressed and within the resources available. While EPA's need carefully to consider applications may slow down the approval process or result in credits not being approved, it remains paramount to ensure credits are not provided to technologies that do not provide actual off-cycle benefits, and thereby do not meet the regulations. In the past, longer time frames for EPA review have not caused manufacturers to lose credits where credits are determined by EPA to be warranted under the regulations. EPA believes that the changes EPA is making to the program will help streamline the program and reduce confusion, thus helping to reduce the time necessary to evaluate applications and provide final decisions to manufacturers.

(7) *Supplier Role in the Off-Cycle Credits Program*

Prior to proposal, EPA heard from many suppliers and their trade associations about an interest in allowing suppliers to have a formal, regulatorily defined role in the off-cycle credits

---

<sup>3414</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073; Global Automakers, Detailed Comments, NHTSA-2018-0067-12032.

program.<sup>3415</sup> EPA requested comment on providing a pathway for suppliers, along with at least one auto manufacturer partner, to submit off-cycle applications for EPA approval. As described in the proposal, under such an approach, an application submitted by a supplier and vehicle manufacturer would establish a credit and/or methodology for demonstrating credits that all auto manufacturers could then use in their subsequent applications. EPA requested comment on requiring that the supplier be partnered in a substantive way with one or more auto manufacturers to ensure that there is a practical interest in the technology prior to EPA investing resources in the approval process. The supplier application would be subject to public review and comment prior to an EPA decision. However, once approved, subsequent auto manufacturer applications requesting credits based on the supplier methodology would not be subject to public review. Under this concept, the credits would be available provisionally for a limited period of time, allowing manufacturers to implement the technology and collect data on their vehicles in order to support a continuation of credits for the technology in the longer term. Also, as envisioned by EPA in its request for comment, the provisional credits could be included under the menu credit cap since they would be based on a general analysis of the technology rather than manufacturer-specific data.

Auto manufacturers' and suppliers' comments were generally supportive of an expanded role for suppliers in the off-cycle credit program. The Auto Alliance supported allowing a supplier to lead the application process but did not support the provisional credit concept since the follow-up testing conducted by manufacturers may not support the level of credits initially

---

<sup>3415</sup> 83 FR 43461.

claimed by the supplier, resulting in a lower than anticipated credit.<sup>3416</sup> Instead, the Auto Alliance suggested a separate cap for supplier-based credits and noted that manufacturers could submit their own data if they wanted to pursue credits levels that exceeded the cap. General Motors similarly disagreed with the provisional credits that might be rescinded if subsequent testing does not fully validate the value of the technology.<sup>3417</sup> MEMA supported the request for comments regarding a supplier-led process but did not support requiring that suppliers have an auto manufacturer partner.<sup>3418</sup> MEMA commented that there would be no incentive for a supplier to go through the product/technology development process, collect the necessary data, and undertake the full application process for a product/technology that would not generate manufacturer interest.

At this time, EPA believes additional discussions with interested parties and an opportunity for public comment, both of which are beyond the scope of this rulemaking, are needed. EPA continues to believe such an approach could encourage the further development of off-cycle technologies, but must be done in a reasonable way that ensures the credits are based on real-world emissions reductions.

Under the approach suggested by the Auto Alliance, manufacturers could claim supplier-based credits indefinitely and EPA might never receive any manufacturer data substantiating the credits unless that data supported a credit that exceeded the level established through the supplier process. EPA is concerned such a one-way ratchet approach could result in the loss of emissions

---

<sup>3416</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

<sup>3417</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

<sup>3418</sup> MEMA, EPA-HQ-OAR-2018-0283-5692. *See*

<https://www.mema.org/sites/default/files/resource/MEMA%20CAFE%20and%20GHG%20Vehicle%20Comments%20FINAL%20with%20Appendices%20Oct%2026%202018.pdf>.

benefits and undermine the integrity of the off-cycle credit program. EPA also remains concerned about the potential for a significantly increased volume of credit applications, including the potential for applications for proposed technologies that manufacturers might in reality have no interest in adopting. EPA understands MEMA's perspective on the issue of requiring a manufacturer partner, but a supplier-only process would potentially open the door to many requests such that the agency would need to expend considerable additional resources. EPA notes that nothing in the current regulations prevents collaboration between manufacturers and suppliers. Suppliers can initiate this process; manufacturer participation will be necessary to complete an application. EPA will provide additional clarity about this process through a subsequent technical amendments rulemaking.

(8) *Other Considerations*

Avista Oil commented that EPA should provide an opportunity for credits based on the use of recycled engine oil. Avista Oil commented that there are CO<sub>2</sub> emissions reductions associated with the use of recycled used engine oil and that vehicle manufacturers should be awarded credits for the use of recycled oil. Avista Oil's comment is not within the scope of the rulemaking. The off-cycle credits program focuses on providing credits for technologies that, when applied to the vehicle, the result is lower quantifiable real-world emissions from the vehicle. According to Avista Oil's comment, their recycled oil technology benefits are associated with the recycling process rather than lowering vehicle emissions on the road. Therefore, EPA would not view the technology as eligible for off-cycle credits, and EPA did not propose any other credit specific to the use of recycled engine oil.

Several commenters recommended that EPA raise the credit caps and credit values for thermal controls based on recent work by the National Renewable Energy Lab (NREL). Commenters suggested that credit values should be raised by 64 percent. In response, as discussed in the preamble, EPA is retaining the current menu credit caps and menu credit values due to uncertainties involved with the emissions projections and estimated credit values. Manufacturers may generate additional credits through the off-cycle credits program using the other two pathways by providing individual vehicle data. EPA recognizes additional modeling analysis has been performed by NREL that indicates the potential benefit of all thermal technologies including glazing. EPA designed the thermal control program and related caps based on previous NREL work and applied the thermal caps at the current levels to account for the wide range of uncertainties -- including the uncertainty of the benefit from the combination of thermal technologies and the uncertainty highlighted by the different credit levels across the NREL studies. EPA believes the separate current thermal menu program cap and AC efficiency program cap continue to be reasonable for application across the fleet given these uncertainties.

Enhanced Protective Glass Automotive Association (EPGAA) and Vitro commented that the regulations established by the 2012 rule included an oversight in defining the baseline T<sub>t</sub>s (the metric used to evaluate thermal reflectivity of glass). EPGAA commented that there was an omission in the case of trucks, where the regulations do allow the use of privacy glass in locations other than the windshield and the front doors. The commenter discussed that the reference baseline glass for trucks, SUVs, and CUVs should have already included privacy glass for some of the rearward windows. In response, EPA recognized when the thermal credit program was finalized in 2012 that some of the vehicles within the reference fleet upon which the credits were based were already composed of vehicles with this type of thermal reflective

glass. However, the agency found it difficult to estimate what portion of the fleet contained privacy glass and what the Tts rating was for privacy glass across the fleet. Because of this lack of specificity in the fleet composition and glass ratings, the agencies determined that the most appropriate approach was to allow credit for any glass meeting the finalized Tts requirements, and the total thermal cap was designed to account for this and other uncertainties.

Ford and others commented that thermal control technology credit caps should be implemented on a fleet average basis rather than on a “per VIN” basis. These commenters argued that the per VIN basis creates a reporting burden that is misaligned with the current reporting structure and creates program complexity and unnecessary workload. In response, EPA continues to believe that applying the thermal control credit cap on a per vehicle (per VIN) basis is appropriate due to the synergistic effects among these technologies. The CO2 reduction potential of applying thermal control technologies is limited within any given vehicle. The program has been implemented in this manner since MY2014, and manufacturers have in fact reported the necessary information to generate thermal control credits.

Gentherm, GM, MEMA, and The ITB Group commented that cooled seats should be added to the menu based on the approved GM off-cycle credits application and NREL study. EPA and NHTSA are not adding cooled seat technology to the menu because the agencies have received data from only a single manufacturer. By contrast, for the technologies EPA and NHTSA are adding to the menu in this final rule, the agencies have assessed data from multiple manufacturers. EPA notes however that the streamlining provisions being finalized in this action should facilitate other manufacturers in being able to apply for off-cycle credits by using GM’s methodology.

Finally, on October 1, 2018, EPA proposed a technical correction separate from the SAFE Vehicles rulemaking for the off-cycle credits pathway based on 5-cycle testing (83 FR 49344). This proposal would correct an error in the regulations established as part of the 2012 final rule. Some commenters expressed their support for the correction as part of their SAFE Vehicles rule comments. EPA notes that this correction continues to be part of a separate rulemaking and is not being addressed in the SAFE Vehicles final rule.

*c) Final Decisions on the 2016 Alliance/Global Petition*

*(1) Retroactive A/C and Off-Cycle CAFE Adjustments*

In 2016, the Alliance and Global submitted a petition for rulemaking, which included requests that: (1) NHTSA allow retroactive credits for A/C and off-cycle incentives for MYs 2012 to 2016; and (2) NHTSA and EPA revisit the average A/C efficiency benefit calculated by EPA applicable to MYs 2012 through 2016. The Alliance/Global argued that A/C efficiency improvements were not properly acknowledged in the CAFE program, and that manufacturers had exceeded the A/C efficiency improvements estimated by the agencies. The petitioners requested that EPA also amend its regulations such that manufacturers would be entitled to additional A/C efficiency improvement benefits retroactively. The petitioners also argued that NHTSA incorrectly stated the agency had taken off-cycle adjustments into consideration when setting standards for MYs 2017 through 2025, but not for MYs 2010-2016. The Alliance/Global further contended that because neither NHTSA nor EPA considered off-cycle adjustments in formulating the stringency of the MY 2012-2016 standards, NHTSA should retroactively grant manufacturers off-cycle adjustments for those model years as EPA did. Doing so, they said, would maintain consistency between the agencies' programs.

Of the two agencies, EPA was the first to establish an off-cycle technology program. For MYs 2012 through 2016, EPA allowed manufacturers to request off-cycle credits for “technologies that achieve [CO<sub>2</sub>] reductions that are not reflected on current test procedures...”<sup>3419</sup> In the subsequent MY 2017 and later rulemaking, NHTSA joined EPA and included an off-cycle program for CAFE compliance. The Alliance/Global petition cited a statement in the MYs 2012-2016 final rule as affirmation that NHTSA took off-cycle adjustments into account in formulating the MYs 2012-2016 stringencies, and therefore should allow manufacturers to earn off-cycle benefits in model years that have already passed.

In the NPRM, NHTSA tentatively decided to retain the structure of the existing A/C efficiency program and not extend it to MYs 2010 through 2016. For the rulemaking for MYs 2012 through 2016, NHTSA determined it was unable to consider improvements manufacturers made to passenger car A/C efficiency in calculating CAFE compliance.<sup>3420, 3421</sup> However, EPA did consider passenger car improvements to A/C efficiency for that timeframe. To allow manufacturers to build one fleet that complied with both EPA and NHTSA standards, the CAFE and CO<sub>2</sub> standards were offset to account for the differences borne out of A/C efficiency improvements. Specifically, the agencies converted EPA’s grams/mile standards to NHTSA mpg (CAFE) standards. EPA then estimated the average amount of improvement manufacturers were expected to earn via improved A/C efficiency. From there, NHTSA took EPA’s converted mpg standard and subtracted the average improvement attributable to improvement in A/C

---

<sup>3419</sup> 75 FR 25341, 25344 (May 7, 2010). EPA had also provided an option for manufacturers to claim “early” off-cycle credits in the 2009-2011 time frame.

<sup>3420</sup> At that time, NHTSA stated “[m]odernizing the passenger car test procedures, or even providing similar credits, would not be possible under EPCA as currently written.” 75 FR 25557 (May 7, 2010).

<sup>3421</sup> 74 FR 49700 (Sept. 28, 2009).

efficiency. NHTSA set its standard at this level to allow manufacturers to comply with both standards with similar levels of technology.<sup>3422</sup>

Likewise, EPA tentatively decided in the NPRM not to modify its regulations to change the way to account for A/C efficiency improvements. EPA believed this was appropriate as manufacturers decided what fuel economy-improving technologies to apply to vehicles based on the standards as finalized in 2010.<sup>3423</sup> This included deciding whether to apply traditional tailpipe technologies, A/C efficiency improvements, or both. Granting A/C efficiency adjustments to manufacturers retroactively could result in arbitrarily varying levels of adjustments granted to manufacturers, similar to the Alliance/Global request regarding retroactive off-cycle adjustments. Thus, the existing A/C efficiency improvement structure for MYs 2010 through 2016 would remain unchanged.

NHTSA also tentatively decided manufacturers should not be granted retroactive off-cycle adjustments for MYs 2010 through 2016, and presented a number of clarifications to justify the denial. In particular, Alliance/Global pointed to a general statement where NHTSA, while discussing consideration of “the effect of other motor vehicle standards of the Government on fuel economy,” stated that that rulemaking resulted in consistent standards across the program.<sup>3424</sup> The Alliance/Global petition took this statement as a blanket assertion that NHTSA’s consideration of all “relevant technologies” included off-cycle technologies. To the

---

<sup>3422</sup> *Id.*

<sup>3423</sup> In the MY 2017 and later rulemaking, NHTSA reaffirmed its position it would not extend A/C efficiency improvement benefits to earlier model years. 77 FR 62720 (Oct. 15, 2012).

<sup>3424</sup> *Id.*

contrary, as quoted above, NHTSA explicitly stated it had not considered these off-cycle technologies.<sup>3425</sup>

The fact that NHTSA had not taken off-cycle adjustments into consideration in setting its MYs 2012-2016 standards makes granting the Alliance/Global request inappropriate. Doing so could result in a question as to whether the MY 2012-2016 standards were maximum feasible under 49 U.S.C. 32902(b)(2)(B). If NHTSA had considered industry's ability to earn off-cycle adjustments—an incentive that allows manufacturers to utilize technologies other than those that were being modeled as part of NHTSA's analysis—the agency might have concluded more stringent standards were maximum feasible. Additionally, granting off-cycle adjustments to manufacturers retroactively raises questions of equity. NHTSA issued its MYs 2012-2016 standards without an off-cycle program, and manufacturers had no reason to anticipate that NHTSA would allow the use off-cycle technologies to meet fuel economy standards. Therefore, manufacturers made fuel economy compliance decisions with the expectation that they would have to meet fuel economy standards using on-cycle technologies. Generating off-cycle adjustments retroactively would arbitrarily reward some (and potentially disadvantage other) manufacturers for compliance decisions they made without the knowledge such technologies would be eligible for NHTSA's off-cycle program. Thus, NHTSA tentatively decided to deny Alliance/Global's request for retroactive off-cycle adjustments.

---

<sup>3425</sup> Likewise, EPA stated it had not considered off-cycle technologies in finalizing the MYs 2012-2016 rule. "Because these technologies are not nearly so well developed and understood, EPA is not prepared to consider them in assessing the stringency of the CO<sub>2</sub> standards." *Id.* at 25438.

It is worth noting that in the MYs 2017 and later rulemaking, NHTSA and EPA did include off-cycle technologies in establishing the stringency of the standards. As Alliance/Global noted, NHTSA and EPA limited their consideration to stop-start and active aerodynamic features because of limited technical information on these technologies.<sup>3426</sup> At that time, the agencies stated they “have virtually no data on the cost, development time necessary, manufacturability, etc. [sic] of these technologies. The agencies thus cannot project that some of these technologies are feasible within the 2017-2025 timeframe.”<sup>3427</sup>

As described above, NHTSA first allowed manufacturers to generate off-cycle technology fuel consumption improvement values equivalent to CO<sub>2</sub> off-cycle credits in MY 2017.<sup>3428</sup> In finalizing the rule covering MYs 2017 and later, NHTSA declined to retroactively extend its off-cycle program to apply to model years 2012 through 2016,<sup>3429</sup> explaining “NHTSA did not take [off-cycle credits] into account when adopting the CAFE standards for those model years. As such, extending the credit program to the CAFE program for those model years would not be appropriate.”<sup>3430</sup>

In the NPRM, NHTSA and EPA sought any further comments on the tentative denials of the retroactive requests in the Alliance/Global. The Auto Alliance and Fiat Chrysler provided additional comments on the tentative denial of the petition requests from the Alliance/Global.

---

<sup>3426</sup> Alliance/Global Petition at 7.

<sup>3427</sup> Draft Joint Technical Support Document: Rulemaking for 2017-2025 Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards (November 2011), p. 5-57.

<sup>3428</sup> 77 FR 62840 (Oct. 15, 2012).

<sup>3429</sup> *See id.*; EPA decided to extend provisions from its MY 2017 and later off-cycle program to the 2012-2016 model years.

<sup>3430</sup> *Id.*

The commenters cited that the widening gap between the regulatory standards and actual industry-wide new vehicle average fuel economy that has become evident since 2016, despite the growing use of improvement “credits” from various flexibility mechanisms, such as off-cycle technology credits, mobile air conditioner efficiency credits, mobile air conditioner refrigerant leak reduction credits and credits from electrified vehicles.<sup>3431</sup> The commenters believe that applying retroactive credits for the new flexibilities for MYs 2012 to 2016 can address the current compliance deficiencies.

Upon consideration of the issue, NHTSA is finalizing its decision to deny any retroactive off-cycle adjustments in the CAFE program for MYs 2012-2016. As mentioned in the NPRM, NHTSA is concerned about the negative impact of allowing retroactive credits, which could undermine the stringency of the MYs 2012-2016 standards. EPA is finalizing its decision not to modify its regulations to change the benefits for A/C efficiency improvements. As mentioned by EPA, the current approach creates uniformity and objectivity in determining A/C efficiency benefits. Consequently, because EPA is maintaining the current A/C determination methodology and NHTSA already considered those A/C adjustments in its MYs 2012-2016 CAFE standards, NHTSA is also finalizing its decisions in this rule to deny any retroactive A/C adjustments in the CAFE program for MYs 2012-2016.

---

<sup>3431</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073; Fiat Chrysler, Detailed Comments, NHTSA-2018-0067-11943.

(2) *Petition Requests on A/C Efficiency and Off-Cycle  
Program Administration*

As discussed above, NHTSA and EPA jointly administer the off-cycle program. The 2016 Alliance/Global petition requested that EPA and NHTSA make various adjustments to the off-cycle program; specifically, the petitioners requested that the agencies should:

- re-affirm that technologies meeting the stated definitions are entitled to the off-cycle credit at the values stated in the regulation;
- re-acknowledge that technologies shown to generate more emissions reductions than the pre-approved amount are entitled to additional credit;
- confirm that technologies not in the null vehicle set but which are demonstrated to provide emissions reductions benefits constitute off-cycle credits; and
- modify the off-cycle program to account for unanticipated delays in the approval process by providing that applications based on the 5-cycle methodology are to be deemed approved if not acted upon by the agencies within a specified timeframe (for instance 90 days), subject to any subsequent review of accuracy and good faith.<sup>3432</sup>

With respect to Alliance/Global's request regarding off-cycle technologies that demonstrate emissions reductions greater than what is allowable from the menu, this final rule retains that capability. As was the case for MYs 2017-2021, a manufacturer may still apply for FCIVs and CO<sub>2</sub> credits beyond the values listed on the menu, provided the manufacturer

---

<sup>3432</sup> Alliance/Global Petition at 20.

demonstrates the CO<sub>2</sub> and fuel economy improvement.<sup>3433</sup> This includes the two-alternative processes for demonstrating CO<sub>2</sub> reductions and fuel economy improvement for gaining benefits using either the 5-cycle or alternative approval methodologies.<sup>3434</sup>

The agencies have considered Alliance/Global's requests to streamline aspects of the A/C efficiency and off-cycle programs in response to the issues outlined above. Among other things, Alliance/Global requested that the agencies consider providing for a default acceptance of petitions for off-cycle credits after a specified period of time, provided that all required information has been provided, to accelerate the processing of off-cycle credit requests. While the agencies agree with the merits of A/C efficiency and off-cycle programmatic improvements, there are significant concerns with the concept of approving petition requests by default because such requests may not address program issues like uncertainty in quantifying program benefits, or general program administration.

Based on its consideration of the issues raised by the Alliance/Global, EPA has adopted in this final rule new processes for streamlining the compliance mechanisms for approving off-cycle and applications as discussed in the preceding section.

### *(3) Other EPA Responses to Alliance Requests*

One issue raised in the Alliance/Global Automakers June 2016 petition (item 6 titled "Refrain from Imposing Unnecessary Restrictions on the Use of Credits") for EPA's consideration concerns how credits are managed within the CO<sub>2</sub> program. The Alliance and

---

<sup>3433</sup> 77 FR 62837 (Oct. 15, 2012).

<sup>3434</sup> 40 CFR 86.1869-12.

Global Automakers suggested that EPA allow more flexibility in using credits generated under the various credit programs such as air conditioning or off-cycle credits by allowing them to be carried forward or back independently. Under this approach, a manufacturer would be allowed, for example, to carry their air conditioning credits back to cover a previous deficit while running a deficit in a current model year. The Alliance referred to this petition request in their comments, noting they believe the request “remains pertinent in the context of this rulemaking.”

In response, EPA did not raise this issue or any related programmatic changes in the proposal and therefore these comments are not within the scope of the rulemaking. EPA notes the GHG and CAFE programs are harmonized on the aggregation of credits.

The automakers’ petition also requested that EPA correct the multiplier equation in the regulations so that manufacturers may generate the intended number of credits (item 8, “Correct the Multiplier for BEVs, PHEVs, FCVs, and CNGs”). This request concerns an error in the regulations established in the 2012 Final Rule that results in manufacturers generating fewer than intended for MY 2017-2021 vehicles in some cases. In October 2018, in response to this petition request, EPA issued a proposed rule separate from the SAFE Vehicles NPRM to correct the error in the previously established regulations. EPA will continue to address this issue and related comments in that separate rulemaking. CAFE does not include multiplier credits and therefore this is not a harmonization issue.

#### 4. Specialty Vehicles with Low Mileage (SVLM)

In response to the NPRM, Volkswagen submitted comments seeking to adopt a new flexibility for specialty vehicles with low mileage (SVLM).<sup>3435</sup> The flexibility would apply to specialty vehicles produced at low volumes and produced for infrequent use. They argued these specialty vehicles do not approach the vehicle miles traveled of typical vehicles. They requested that NHTSA and EPA allow the SVLM flexibility for vehicles that demonstrate limited predicted driving use. The flexibility would allot each manufacturer a limited annual production of 5,000 SVLM vehicles. It was also proposed that, within this limited product volume, each SVLM would retain its footprint derived performance target (per model type), but would utilize a modified VMT for determining any credits or debits associated with the performance of these vehicles within the manufacturer's fleet.

The agencies have considered the request from Volkswagen for credits or debits and fuel economy adjustments for SVLM vehicles and are denying the request. NHTSA notes that Congress prescribed alternative (reduced) CAFE standards for low-volume manufacturers, codified in 49 CFR part 525. Low-volume manufacturers' vehicles are often high-end sports cars and are not typically driven by their owners for long distances. Congress limited this exemption under the CAFE program to manufacturers of fewer than 10,000 passenger automobiles.<sup>3436</sup> EPA has a similar program for small volume manufacturers which are defined as manufacturers with average sales for the three most recent consecutive model years of less

---

<sup>3435</sup> Volkswagen, Detailed Comments, NHTSA-2017-0069-0583.

<sup>3436</sup> 49 U.S.C. 32902(d)(1).

than 5,000 vehicles.<sup>3437</sup> The flexibility proposed by Volkswagen would presumably be in addition to these existing provisions, but Volkswagen does not identify a source of authority for it. The agencies also have a number of questions about how specifically a SVLM concept might be implemented, such as whether every manufacturer would simply identify the 5,000 vehicles with the lowest projected VMT or lowest fuel economy and therefore qualify for credits for 5,000 vehicles every model year, or whether there should be additional criteria for vehicles to be included. The NPRM did not seek comment on a SVLM concept and the agencies did not receive other comments on the requested program. Therefore, the agencies are not adopting the SVLM concept suggested by Volkswagen.

E. CO<sub>2</sub> and CAFE Compliance Issues Not Addressed in the NPRM

1. CO<sub>2</sub> and CAFE Adjustments for 5-Cycle Testing

EPA and NHTSA received several comments requesting that the agencies revise current CAFE test procedures to use EPA's 5-cycle test procedures in place of the 2-cycle test procedures that have been largely unchanged since the inception of the CAFE program, or offset measured 2-cycle test fuel economy and CO<sub>2</sub> emissions for CO<sub>2</sub> and CAFE compliance. Walter Kreucher commented "some technologies (Hybrid Electric) have penalties on the road that are not reflected on the tests used to determine CAFE compliance. ...If the Agencies want to provide adjustment factors for A/C and other 'Off-Cycle' conditions it must do so in both the positive and negative direction" (sic).<sup>3438</sup> AVE commented that the agencies should use 5-cycle

---

<sup>3437</sup> 40 CFR 86.1818-12(g).

<sup>3438</sup> Walter Kreucher, Detailed Comments, NHTSA-2018-0067-0444.

procedures rather than 2-cycle procedures, arguing that the 5-cycle model better demonstrates real-world driving conditions and would lead to a more simplified credit allocation system.<sup>3439</sup> BorgWarner echoed those comments, stating that the 5-cycle test is more accurate than the 2-cycle test and would reduce the need for credit adjustments.<sup>3440</sup> Jeremy Michalek commented that the fuel economy values the public sees reflected on vehicles for purchase (e.g., on the Monroney label or in new car advertising) is calculated from the 5-cycle test; updating the 2-cycle test to capture more of the vehicle's fuel efficiency factors would allow for better consistency and a more accurate fuel efficiency measure.<sup>3441</sup> The Auto Alliance proposed that the EPA revise its methodology for calculating off-cycle improvements when using the 5-cycle methodology by subtracting the 2-cycle benefit from the 5-cycle benefit to ensure credits are calculated properly.<sup>3442</sup>

The NPRM did not seek comment on revising compliance test procedures to use 5-cycle test procedures in place of 2-cycle test procedures, either entirely or broadly. Such a change would require extensive assessment and analysis to consider how changes could be implemented and what standards might be maximum feasible for CAFE and appropriate and reasonable for CO<sub>2</sub> for new test procedures. There has been no analysis conducted to estimate the impacts of such a change on the levels of the standards. Therefore, making these requested changes is outside the scope of this rulemaking.

<sup>3441</sup> Jeremy Michalek, et al., Detailed Comments, NHTSA-2018-0067-11903.

<sup>3442</sup> Auto Alliance, Detailed Comments, NHTSA-2018-0067-12073.

## 2. National Zero Emissions Vehicle Concept

Although the agencies did not discuss or request comment on a National Zero Emissions Vehicle (NZEV) program concept, several organizations commented on that topic. Some discussed ideas from a task force that was formed by the governors of nine States who signed a memorandum of understanding (MOU) committing to undertake joint cooperative actions to build a robust market for ZEVs under their individual state programs. Collectively, these States have committed to having at least 3.3 million ZEVs operating on their roadways by 2025. ZEVs include battery-electric vehicles (BEVs), plug-in hybrid electric vehicles (PHEVs), and hydrogen fuel-cell electric vehicles (FCEVs). Comments on an NZEV concept were received from General Motors, CARB, Edison Electric Institute, Honda, NCAT, Workhorse Group, and Volvo.

General Motors offered comments supporting an NZEV program, stating that it continues to expect California to be the leader of the EV market but hopes a national effort will be put forth, making the U.S. a global leader in EV technology development and deployment.<sup>3443</sup> General Motors stated it believes an NZEV program would further U.S. national security interests, make the U.S. more competitive with China, which already has an NZEV program, and reduce U.S. dependence on foreign petroleum. General Motors requested that EPA incentivize EV deployment, including providing credits for autonomous EVs and EVs that are used in rideshare programs.<sup>3444</sup> General Motors outlined their proposed NZEV program which would include increasing ZEV requirements annually, establishing credit banks for manufacturers based on national ZEV sales, and ZEV multipliers for vehicles over 5,250 lbs., autonomous vehicles

---

<sup>3443</sup> General Motors, Detailed Comments, NHTSA-2018-0067-11858.

<sup>3444</sup> General Motors, Detailed Comments, NHTSA-2018-0067-11858.

using EV, and EVs in rideshare programs. General Motors also proposed that requirements would be revisited if EV battery cell were not available at the costs Argonne National Lab forecasts by 2025. General Motors also suggested implementing a Zero Emissions Task Force that would promote complementary policies. General Motors acknowledged that the NZEV program would have to be subject to acceleration or delay depending on how quickly technologies are incentivized like battery cost.

CARB recommended a national ZEV multiplier, stating that a national incentive would help ensure ZEVs and PHEVs were being produced for sale beyond the ten States that have ZEV programs.<sup>3445</sup> The Edison Electric Institute supported increasing stringency of fuel economy and CO<sub>2</sub> standards and incorporating policies from ZEV States to create a “One National Program.”<sup>3446</sup> Workhorse Group commented that a national ZEV mandate, where agencies progressively increase the mandated percentage of electric vehicles in every fleet, merits serious consideration by the agencies. They contended that an NZEV would have to work with the current State ZEV mandates and not preempt the progress already made.<sup>3447</sup> Volvo, and Honda were proponents of incorporating ZEV standards into a national program. Volvo requested nationwide credits for ZEVs since there are 40 States without ZEV mandates.<sup>3448</sup> Honda mentioned that incorporating California’s ZEV credits into the national program would reduce compliance costs for manufacturers while incentivizing technological development.<sup>3449</sup> NCAT recommended in their comment that EPA provide enhanced credits for EVs, PHEVs, and FCVs

---

<sup>3445</sup> CARB, Detailed Comments, NHTSA-2018-0067-11873.

<sup>3446</sup> Edison Electric Institute, Detailed Comments, NHTSA-2018-0067-11918.

<sup>3447</sup> Workhorse Group, Detailed Comments, NHTSA-2018-0067-12215.

<sup>3448</sup> Volvo, Detailed Comments, NHTSA-2018-0067-12036.

<sup>3449</sup> Honda, Detailed Comments, NHTSA-2018-0067-11818.

that are more stringent than California (and other States) ZEV mandates, making the national program credits “additional” to state ZEV compliance credits.<sup>3450</sup>

Northeast States for Coordinated Air Use Management (NESCAUM) commented that an aggressive reduction in emissions will not occur without national ZEV standards which will drive development of advanced clean vehicle technologies.<sup>3451</sup>

The NPRM did not propose or request comment on an NZEV concept or program, as such, and establishing such a program would be outside the scope of this rulemaking. Such a concept would require thorough assessment and full rulemaking notice and comment. There are also policy questions about what the appropriate level of potential incentives should be and whether certain technologies should receive greater incentives than other technologies, and if so, on what basis and by what amounts. Also, for the CAFE program, incentives for technologies are almost entirely prescribed by statute, and there are questions about how the CAFE program could implement an NZEV program in alignment with EPCA and EISA. Therefore, the agencies have decided not to implement an NZEV program as part of this rulemaking.

### 3. CO<sub>2</sub> In-Use Requirements

Current in-use regulations outlined in 86.1845-04 provide flexibility in determining the applicable number of test vehicles per test group. Each large volume manufacturer is provided the flexibility to employ small volume sampling allowances for a limited number of total annual production units. In response to the NPRM, Volkswagen is proposing to modify 86.1845-04 to

---

<sup>3450</sup> NCAT, Detailed Comments, NHTSA-2018-0067-11969.

<sup>3451</sup> NESCAUM, Detailed Comments, NHTSA-2018-0067-11691.

provide a separate, additional small volume sampling allowance allocation of annual production volume for a manufacturer's plug-in hybrid vehicles. This additional allowance would only be applicable through the 2025 model year and would only be applicable to CO<sub>2</sub> testing requirements under the in use regulations.

The basis for this flexibility is rooted in the continuing evolution and development of traction drive battery cell chemistries and battery management systems. This ongoing development is aimed at continuously improving such features as energy density, power, cost, and durability. As such, the engineering processes for understanding and quantifying long-term performance are still developing and subject to reevaluation as new chemistries are examined. Manufacturers such as Volkswagen have allocated significant capital in battery testing to ensure that performance is maintained for consumers and are also providing longer term battery warranty provisions.

Volkswagen believes that the targeted flexibility will provide additional time to continue evaluating chemistries and reduce administrative testing burdens for a very limited production allocation per manufacturer. This provision will further support plug-in hybrid technology development and deployment. Volkswagen proposed modifying 86.1845-04 table SO4-07 footnote 2, to read as follows:

<sup>2</sup> Total annual production of groups eligible for testing under small volume sampling plan is capped at a maximum of 14,999 vehicle 49 or 50 state annual sales, or a maximum of 4,500 vehicle California only sales per model year, per large volume manufacturer. Through model year 2025, a separate total annual production of plug-in hybrid electric vehicle groups shall be eligible for testing under small volume sampling plan as

described above. This allocation shall only be applicable to exhaust CO<sub>2</sub> emission standards under this subpart.<sup>3452</sup>

Regarding comments from VW on CO<sub>2</sub> in-use requirements, EPA did not consider the change recommended by VW in the proposal and is not finalizing such a change. EPA believes the current program provides enough flexibility. EPA's general approach for this final rule is also to avoid providing incentives or other unique flexibilities to specific technologies.

#### F. Medium and Heavy-Duty Fuel Efficiency Technical Amendments

NHTSA proposed in the NPRM to make minor technical revisions to correct typographical mistakes and improper references adopted in the agency's 2016 Phase 2 medium- and heavy-duty fuel efficiency rule.<sup>3453</sup> The proposed changes were as follows:

- NHTSA heavy-duty vehicles and engine fuel consumption credit equations. In each credit equation in 49 CFR 535.7, the minus-sign in each multiplication factor was omitted in the final version of the rule sent to the *Federal Register*. For example, the credit equation in Part 535.7(b)(1) should be specified as, Total MY Fleet FCC (gallons) = (Std - Act) × (Volume) × (UL) × (10-2) instead of (102), as currently exists. NHTSA proposed to correct these omissions.
- The CO<sub>2</sub> to gasoline conversion factor: In 49 CFR 535.6(a)(4)(ii) and (d)(5)(ii), NHTSA provides the methodology and equations for converting the CO<sub>2</sub> FELs/FCLs for heavy-duty pickups and vans (gram per mile) and for engines (grams per hp-hr) to

---

<sup>3452</sup> See EPA-HQ-OAR-2018-0283-5689-A1, p.32.

<sup>3453</sup> 81 FR 73478 (Oct. 25, 2016).

their gallon-of-gasoline equivalence. In each equation, NHTSA proposed to correct the conversion factor to 8,887 grams per gallon of gasoline fuel instead of a factor of 8,877 as currently specified.

- Curb weight definition: In 49 CFR 523.2, the reference in the definition for curb weight is incorrect. NHTSA proposed to correct the definition to incorporate a reference to 40 CFR 86.1803 instead of 49 CFR 571.3.

No public comments were received in response to NHTSA's proposed technical corrections. Therefore, NHTSA is finalizing these amendments and incorporating them into its heavy-duty regulations.

## **X. Regulatory Notices and Analyses**

### **A. Executive Order 12866, Executive Order 13563**

Executive Order 12866, "Regulatory Planning and Review" (58 FR 51735, Oct. 4, 1993), as amended by Executive Order 13563, "Improving Regulation and Regulatory Review" (76 FR 3821, Jan. 21, 2011), provides for making determinations whether a regulatory action is "significant" and therefore subject to the Office of Management and Budget (OMB) review and to the requirements of the Executive Order. One comment requested that the agencies provide "a far more robust cost/benefit analysis as required by Executive Order (EO) 12866 and Office of Management and Budget Circular A-4."<sup>3454</sup> The NPRM and this final rule satisfy the

---

<sup>3454</sup> See Anonymous Comment, Docket No. EPA-HQ-OAR-2018-0283-3896, at 4-5 (footnote and citation omitted). As an example, the comment critiqued the NPRM's discussion of the "diminishing returns" of fuel economy benefits, alleging that the discussion "is not backed by reference to data or studies regarding how this conclusion was made." *Id.* at 5. Contrary to the comment's allegation, the conclusion is supported by the analysis from U.S.

requirements of Executive Order 12866, “Regulatory Planning and Review” (58 FR 51735, Oct. 4, 1993), as amended by Executive Order 13563, “Improving Regulation and Regulatory Review” (76 FR 3821, Jan. 21, 2011). Under these Executive Orders, this action is an “economically significant regulatory action” because it is likely to have an annual effect on the economy of \$100 million or more. Accordingly, EPA and NHTSA submitted this action to the OMB for review and any changes made in response to OMB recommendations have been documented in the docket for this action. The benefits and costs of this proposal are described above and in the Final Regulatory Impact Analysis (FRIA), which is located in the docket and on the agencies’ websites.

#### B. DOT Regulatory Policies and Procedures

The rule is also significant within the meaning of the Department of Transportation’s Regulatory Policies and Procedures. The benefits and costs of this proposal are described above and in the FRIA, which is located in the docket and on NHTSA’s website.

#### C. Executive Order 13771 (Reducing Regulation and Controlling Regulatory Costs)

This rule is an E.O. 13771 deregulatory action. Per OMB Memorandum M-17-21, because this rule is deregulatory, it is not required to be offset by two deregulatory actions, as one comment suggested.<sup>3455</sup>

---

Energy Information Administration’s (EIA’s) Annual Energy Outlook (AEO) that was cited in the discussion. *Id.* As noted in the NPRM, the EIA—the statistical and analytical agency within the U.S. Department of Energy (DOE)—is the nation’s premier source of energy information, and every fuel economy rulemaking since 2002 (and every joint CAFE and CO<sub>2</sub> rulemaking since 2009) has applied fuel price projections from EIA’s AEO. *Id.* at 42992 n.24.

<sup>3455</sup> Anonymous Comment, Docket No. EPA-HQ-OAR-2018-0283-3896, at 8.

#### D. Executive Order 13211 (Energy Effects)

Executive Order 13211 applies to any rule that: (1) is determined to be economically significant as defined under E.O. 12866, and is likely to have a significant adverse effect on the supply, distribution, or use of energy; or (2) that is designated by the Administrator of the Office of Information and Regulatory Affairs as a significant energy action. If the regulatory action meets either criterion, the agencies must evaluate the adverse energy effects of the rule and explain why the regulation is preferable to other potentially effective and reasonably feasible alternatives considered.

The rule establishes passenger car and light truck fuel economy standards and tailpipe carbon dioxide and related emissions standards. An evaluation of energy effects of the action and reasonably feasible alternatives considered is provided in NHTSA's EIS and in the FRIA. To the extent that EPA's CO<sub>2</sub> standards are substantially related to fuel economy and, accordingly, petroleum consumption, the EIS and FRIA analyses also provide an estimate of impacts of EPA's rule.

#### E. Environmental Considerations

##### 1. National Environmental Policy Act (NEPA)

Concurrently with this final rule, NHTSA is releasing a Final Environmental Impact Statement (FEIS), pursuant to the National Environmental Policy Act, 42 U.S.C. 4321-4347, and implementing regulations issued by the Council on Environmental Quality (CEQ), 40 CFR part 1500, and NHTSA, 49 CFR part 520. NHTSA prepared the FEIS to analyze and disclose the potential environmental impacts of the proposed CAFE standards and a range of alternatives. The FEIS analyzes direct, indirect, and cumulative impacts and analyzes impacts in proportion to

their significance. It describes potential environmental impacts to a variety of resources, including fuel and energy use, air quality, climate, land use and development, hazardous materials and regulated wastes, historical and cultural resources, noise, and environmental justice. The FEIS also describes how climate change resulting from global carbon emissions (including CO<sub>2</sub> emissions attributable to the U.S. light duty transportation sector under the alternatives considered) could affect certain key natural and human resources. Resource areas are assessed qualitatively and quantitatively, as appropriate, in the FEIS.

Some commenters provided feedback on the “flaws” they identified in the CAFE model, concluding that because it played a significant role in modeling for the DEIS, the DEIS itself was flawed and should be withdrawn and reissued.<sup>3456</sup> The agencies address the comments regarding the CAFE model above in this preamble and in the FRIA. Ultimately, the findings on potential environmental impacts presented in the FEIS are of the same level of intensity and significance as those presented in the DEIS. While in some cases, the directionality of potential air quality emissions changed, the overall impact was generally small. NHTSA concludes that the CAFE model results, as used in the FEIS, do not result in the FEIS providing significant new information for the decisionmaker or the public compared to the DEIS.<sup>3457</sup> NHTSA therefore concludes that a supplemental DEIS is not required.

---

<sup>3456</sup> States of California, Connecticut, Delaware, Hawaii, Iowa, Illinois, Maine, Maryland, Minnesota, North Carolina, New Jersey, New Mexico, New York, Oregon, Rhode Island, Vermont, and Washington; the Commonwealths of Massachusetts, Pennsylvania, and Virginia; the District of Columbia; and the Cities of Los Angeles, New York, Oakland, San Francisco, and San Jose (“California *et. al.*—Detailed NEPA Comments”), Docket No. NHTSA-2017-0069-0625, at 6-11; Environmental Defense Fund, Docket No. NHTSA-2018-0067-11996, at 3-4; and Center for Biological Diversity, *et al.*, Docket No. NHTSA-2018-0067-12123, at 19.

<sup>3457</sup> 40 CFR 1502.9(c)(1)(ii).

NHTSA also performed a national-scale photochemical air quality modeling and health benefit assessment for the FEIS; it is included as Appendix E. The purpose of this assessment was to use air quality modeling and health-related benefits analysis tools to examine the potential air quality-related consequences of the alternatives considered in its Draft Environmental Impact Statement (DEIS). In a comment on the DEIS, the South Coast Air Quality Management District stated that performing the photochemical modeling for the FEIS “comes too late for the public to be able to comment on that analysis,” and that the EIS must be recirculated to allow such public comment.<sup>3458</sup> However, NHTSA publicly stated its intent to conduct the analysis as part of the FEIS in its scoping notice published on July 26, 2017.<sup>3459</sup> The agency noted that this approach was consistent with past practice and resulted from the substantial time required to complete such an analysis. NHTSA also announced that, due to the substantial lead time required, the analysis would be based on the modeling of the alternatives presented in the DEIS, not of the alternatives as presented in the FEIS. NHTSA received no public comments in response to the scoping notice addressing this analytical approach, and the agency proceeded accordingly. Furthermore, while photochemical modeling provides spatial and temporal detail for estimating changes in ambient levels of air pollutants and their associated impacts on human health and welfare, the analysis affirms the estimates that appear in the EIS and does not provide significant new information for the decisionmaker or the public. For these reasons, NHTSA concludes that

---

<sup>3458</sup> South Coast Air Quality Management District, Docket No. NHTSA-2018-0067-5666, at 10. *See also* North Carolina Department of Environmental Quality, Docket No. NHTSA-2018-0067-12025, at 35-37.

<sup>3459</sup> NHTSA, “Notice of Intent to Prepare an Environmental Impact Statement for Model Year 2022–2025 Corporate Average Fuel Economy Standards,” 82 FR 34740, 34743 fn. 15 (Jul. 26, 2017).

inclusion of the photochemical modeling and health benefit assessment in the FEIS is appropriate, and recirculation of the EIS is not required.

NHTSA has considered the information contained in the FEIS in making the final decision described in this final rule.<sup>3460</sup> This preamble and final rule constitute NHTSA's Record of Decision (ROD) under 40 CFR 1505.2 for its promulgation of CAFE standards for MYs 2021-2026. NHTSA has authority to issue its FEIS and ROD simultaneously pursuant to 49 U.S.C. 304a(b) and U.S. Department of Transportation, Office of Transportation Policy, *Guidance on the Use of Combined Final Environmental Impact Statements/Records of Decision and Errata Sheets in National Environmental Policy Act Reviews* (April 25, 2019).<sup>3461</sup> NHTSA has determined that neither the statutory criteria nor practicability considerations preclude simultaneous issuance.

As required by the CEQ regulations,<sup>3462</sup> this final rule (as the ROD) sets forth the following: (1) The agency's decision (Sections V and VIII above); (2) alternatives considered by NHTSA in reaching its decision, including the environmentally preferable alternative (Sections V, VII, and VIII above); (3) the factors balanced by NHTSA in making its decision, including essential considerations of national policy (Section VIII.B above); (4) how these factors and considerations entered into its decision (Section VIII.B above); and (5) the agency's preferences among alternatives based on relevant factors, including economic and technical considerations and agency statutory missions (Section VIII.B.4 above). This section also briefly addresses

---

<sup>3460</sup> The FEIS is available for review in the public docket for this action and in Docket No. NHTSA-2017-0069.

<sup>3461</sup> The guidance is available at <https://www.transportation.gov/sites/dot.gov/files/docs/mission/transportation-policy/permittingcenter/337371/feis-rod-guidance-final-04302019.pdf>.

<sup>3462</sup> 40 CFR 1505.2.

mitigation<sup>3463</sup> and whether all practicable means to avoid or minimize environmental harm from the alternative selected have been adopted.

In the DEIS and in the FEIS, the agency identified a Preferred Alternative. In the DEIS, the Preferred Alternative was identified as Alternative 1 (0.0 Percent Annual Increase in Fuel Economy, MYs 2021-2026), which were the standards the agency proposed in the NPRM. In the FEIS, the Preferred Alternative was identified as Alternative 3 (1.5 Percent Annual Increase in Fuel Economy, MYs 2021-2026). As the FEIS notes, under the Preferred Alternative, on an mpg basis, the estimated annual increases in the average required fuel economy levels between MYs 2021 and 2026 is 1.5 percent for both passenger cars and light trucks.<sup>3464</sup> After carefully reviewing and analyzing all of the information in the public record, the FEIS, and comments submitted on the DEIS and the NPRM, NHTSA has decided to finalize the Preferred Alternative described in the FEIS for the reasons described in this ROD.

NHTSA has considered environmental considerations as part of its balancing of the statutory factors to set maximum feasible fuel economy standards. As a result, the agency has limited the degree or magnitude of the action as appropriate in light of its statutory responsibilities. NHTSA's authority to promulgate fuel economy standards does not allow it to regulate criteria pollutants from vehicles or refineries, nor can NHTSA regulate other factors affecting those emissions, such as driving habits. Consequently, NHTSA must set CAFE

---

<sup>3463</sup> See 40 CFR 1508.20(b) (“*Mitigation* includes ... (b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation...”)

<sup>3464</sup> Because the standards are attribute-based, average required fuel economy levels, and therefore rates of increase in those average mpg values, depend on the future composition of the fleet, which is uncertain and subject to change. When NHTSA describes a percent increase in stringency, we mean in terms of shifts in the *footprint functions* that form the basis for the *actual* CAFE standards (as in, on a gallon per mile basis, the CAFE standards change by a given percentage from one model year to the next).

standards but is unable to take further steps to mitigate the impacts of these standards. Chapter 9 of the FEIS provides a further discussion of mitigation measures in the context of NEPA.

One commenter states that NHTSA, at a minimum, “must include a thorough discussion of all reasonable mitigation measures and detail the appropriate agencies that could implement such measures.”<sup>3465</sup> As examples, the commenter listed: “creating tax breaks for transit and biking, expanding transportation demand management programs for federal employees, implementing a social marketing campaign regarding VMT reduction, increasing dedicated funding for transit and active modes, requiring VMT as a performance measure for federal funding, and providing NEPA guidance on evaluating VMT impacts of federal projects.” Each of the examples listed is beyond NHTSA’s statutory authority. Furthermore, documenting the myriad measures that could reduce VMT or address criteria pollutant or carbon dioxide emissions would provide no added benefit to the decisionmaker or the public. Each of these actions requires their own extensive cost-benefit analysis, are beyond the purview of this action, and are beyond the legal responsibility of NHTSA. NHTSA concludes that the commenter’s request is beyond the bounds of NEPA’s “rule of reason.”<sup>3466</sup>

Another commenter disputes NHTSA’s conclusion that it lacks statutory authority to mitigate the impacts of its CAFE standards. Specifically, the commenter cites to its very authority to set fuel economy standards: “It is axiomatic that fuel efficiency standards set at levels of the No Action Alternative or at more stringent levels would eliminate the additional

---

<sup>3465</sup> California *et. al.*—Detailed NEPA Comments, Docket No. NHTSA-2017-0069-0625, at 31.

<sup>3466</sup> Dep’t of Transp. v. Pub. Citizen, 541 U.S. 752, 772 (2004).

pollution created by the proposed freeze.”<sup>3467</sup> This, however, mischaracterizes mitigation as nothing more than a choice among alternatives. NHTSA is already considering a range of reasonable alternatives and has concluded that alternatives more stringent than the No Action Alternative are beyond reasonable. Furthermore, NHTSA disputes that more stringent fuel economy standards will axiomatically lead to lower levels of criteria pollutant emissions. In fact, because of the rebound effect, higher levels of stringency may result in higher VMT, which may result in criteria pollutant emission increases.

The North Carolina Department of Environmental Quality commented that the proposed changes to the CAFE standards could undermine the integrity of many of the assumptions in various NEPA documents across the United States, in part because EPA required the use of the MOVES2014 model (or a subsequent revision) for transportation conformity determinations.<sup>3468</sup> That version of MOVES incorporates CAFE and CO<sub>2</sub> standards based on the agencies’ actions in 2012 and does not reflect the actions being finalized in this rule. The implication of the commenter’s assertion, however, is that neither NHTSA nor EPA could take any regulatory action regarding CAFE or CO<sub>2</sub> standards, regardless of whether such action was to increase or decrease such standards. Clearly neither agency can be paralyzed from undertaking its statutory obligations because of the independent NEPA obligations related to other ongoing Federal actions. For those actions, responsible officials may need to assess whether this final rule triggers the need for a supplemental NEPA document. However, it is not unique for Federal agencies to take actions or for new information to become available that affects the underlying

<sup>3467</sup> Center for Biological Diversity, *et al.*, Docket No. NHTSA-2018-0067-12123, at 55-56.

<sup>3468</sup> North Carolina Department of Environmental Quality, Docket No. NHTSA-2018-0067-12025, at 37. *See also* Southern Environmental Law Center, EPA-HQ-OAR-2018-0283-0887, at 2-4.

inputs in models, such as EPA's MOVES model, on which NEPA and conformity analyses rely. Over time, those models will be updated to reflect these actions and information. EPA is responsible for approving the availability of models for the use in State implementation plans and transportation conformity analyses. EPA will evaluate and address, as appropriate, the impact of this action on future SIP approval actions. Currently approved emission factor models remain approved for SIPs and transportation conformity analyses, and EPA will work with DOT on the appropriate implementation of Federal requirements based on current and available information.

## 2. Clean Air Act (CAA) as Applied to NHTSA's Action

The CAA (42 U.S.C. 7401 et seq.) is the primary Federal legislation that addresses air quality. Under the authority of the CAA and subsequent amendments, EPA has established National Ambient Air Quality Standards (NAAQS) for six criteria pollutants, which are specifically identified pollutants that have recognized adverse effects on ambient air quality and that can accumulate in the atmosphere as a result of human activity. EPA is required to review each NAAQS every five years and to revise those standards as may be appropriate considering new scientific information.

The air quality of a geographic region is usually assessed by comparing the levels of criteria air pollutants found in the ambient air to the levels established by the NAAQS (taking into account, as well, the other elements of a NAAQS: averaging time, form, and indicator). Concentrations of criteria pollutants within the air mass of a region are measured in parts of a pollutant per million parts (ppm) of air or in micrograms of a pollutant per cubic meter ( $\mu\text{g}/\text{m}^3$ ) of air present in repeated air samples taken at designated monitoring locations using specified

types of monitors. These ambient concentrations of each criteria pollutant are compared to the levels, averaging time, and form specified by the NAAQS in order to assess whether the region's air quality is in attainment with the NAAQS.

When the measured concentrations of a criteria pollutant within a geographic region are below those permitted by the NAAQS, EPA designates the region as an attainment area for that pollutant, while regions where concentrations of criteria pollutants exceed Federal standards are called nonattainment areas. Former nonattainment areas that are now in compliance with the NAAQS are designated as maintenance areas. Each State with a nonattainment area is required to develop and implement a State Implementation Plan (SIP) documenting how the region will reach attainment levels within time periods specified in the CAA. For maintenance areas, the SIP must document how the State intends to maintain compliance with the NAAQS. When EPA revises a NAAQS, each State must revise its SIP to address how it plans to attain the new standard.

No Federal agency may “engage in, support in any way or provide financial assistance for, license or permit, or approve” any activity that does not “conform” to a SIP or Federal Implementation Plan after EPA has approved or promulgated it.<sup>3469</sup> Further, no Federal agency may “approve, accept, or fund” any transportation plan, program, or project developed pursuant to title 23 or chapter 53 of title 49, U.S.C., unless the plan, program, or project has been found to “conform” to any applicable implementation plan in effect.<sup>3470</sup> The purpose of these conformity requirements is to ensure that Federally sponsored or conducted activities do not interfere with

---

<sup>3469</sup> 42 U.S.C. 7506(c)(1).

<sup>3470</sup> 42 U.S.C. 7506(c)(2).

meeting the emissions targets in SIPs, do not cause or contribute to new violations of the NAAQS, and do not impede the ability of a State to attain or maintain the NAAQS or delay any interim milestones. EPA has issued two sets of regulations to implement the conformity requirements:

(1) The Transportation Conformity Rule<sup>3471</sup> applies to transportation plans, programs, and projects that are developed, funded, or approved under title 23 or chapter 53 of title 49, U.S.C.

(2) The General Conformity Rule<sup>3472</sup> applies to all other federal actions not covered under transportation conformity. The General Conformity Rule establishes emissions thresholds, or *de minimis* levels, for use in evaluating the conformity of an action that results in emissions increases.<sup>3473</sup> If the net increases of direct and indirect emissions are lower than these thresholds, then the project is presumed to conform and no further conformity evaluation is required. If the net increases of direct and indirect emissions exceed any of these thresholds, and the action is not otherwise exempt, then a conformity determination is required. The conformity determination can entail air quality modeling studies, consultation with EPA and state air quality agencies, and commitments to revise the SIP or to implement measures to mitigate air quality impacts.

The CAFE standards and associated program activities are not developed, funded, or approved under title 23 or chapter 53 of title 49, United States Code. Accordingly, this action and associated program activities are not subject to the Transportation Conformity Rule. Under the General Conformity Rule, a conformity determination is required where a Federal action

---

<sup>3471</sup> 40 CFR part 51, subpart T, and part 93, subpart A.

<sup>3472</sup> 40 CFR part 51, subpart W, and part 93, subpart B.

<sup>3473</sup> 40 CFR 93.153(b).

would result in total direct and indirect emissions of a criteria pollutant or precursor originating in nonattainment or maintenance areas equaling or exceeding the rates specified in 40 CFR 93.153(b)(1) and (2). As explained below, NHTSA's action results in neither direct nor indirect emissions as defined in 40 CFR 93.152.

The General Conformity Rule defines direct emissions as “those emissions of a criteria pollutant or its precursors that are caused or initiated by the Federal action and originate in a nonattainment or maintenance area and occur at the same time and place as the action and are reasonably foreseeable.”<sup>3474</sup> Because NHTSA's action would set fuel economy standards for light duty vehicles, it would cause no direct emissions consistent with the meaning of the General Conformity Rule.<sup>3475</sup>

Indirect emissions under the General Conformity Rule are “those emissions of a criteria pollutant or its precursors (1) that are caused or initiated by the federal action and originate in the same nonattainment or maintenance area but occur at a different time or place as the action; (2) that are reasonably foreseeable; (3) that the agency can practically control; and (4) for which the agency has continuing program responsibility.”<sup>3476</sup> Each element of the definition must be met to qualify as indirect emissions. NHTSA has determined that, for purposes of general conformity, emissions that may result from its final fuel economy standards would not be caused by NHTSA's action, but rather would occur because of subsequent activities the agency cannot

---

<sup>3474</sup> 40 CFR 93.152.

<sup>3475</sup> *Dep't of Transp. v. Pub. Citizen*, 541 U.S. at 772 (“[T]he emissions from the Mexican trucks are not ‘direct’ because they will not occur at the same time or at the same place as the promulgation of the regulations.”). NHTSA's action is to establish fuel economy standards for MY 2021–2026 passenger car and light trucks; any emissions increases would occur in a different place and well after promulgation of the final rule.

<sup>3476</sup> 40 CFR 93.152.

practically control. “[E]ven if a Federal licensing, rulemaking, or other approving action is a required initial step for a subsequent activity that causes emissions, such initial steps do not mean that a Federal agency can practically control any resulting emissions.”<sup>3477</sup>

As the CAFE program uses performance-based standards, NHTSA cannot control the technologies vehicle manufacturers use to improve the fuel economy of passenger cars and light trucks. Furthermore, NHTSA cannot control consumer purchasing (which affects average achieved fleetwide fuel economy) and driving behavior (i.e., operation of motor vehicles, as measured by VMT). It is the combination of fuel economy technologies, consumer purchasing, and driving behavior that results in criteria pollutant or precursor emissions. For purposes of analyzing the environmental impacts of the alternatives considered here and under NEPA, NHTSA has made assumptions regarding all of these factors. The agency’s FEIS predicts that increases in air toxic and criteria pollutants would occur in some nonattainment areas under certain alternatives. However, the standards and alternatives do not mandate specific manufacturer decisions, consumer purchasing, or driver behavior, and NHTSA cannot practically control any of them.<sup>3478</sup>

In addition, NHTSA does not have the statutory authority to control the actual VMT by drivers. As the extent of emissions is directly dependent on the operation of motor vehicles, changes in any emissions that result from NHTSA’s CAFE standards are not changes the agency can practically control or for which the agency has continuing program responsibility.

---

<sup>3477</sup> 40 CFR 93.152.

<sup>3478</sup> See, e.g., *Dep’t of Transp. v. Pub. Citizen*, 541 U.S. 752, 772-73 (2004); *S. Coast Air Quality Mgmt. Dist. v. Fed. Energy Regulatory Comm’n*, 621 F.3d 1085, 1101 (9th Cir. 2010).

Therefore, the final CAFE standards and alternative standards considered by NHTSA would not cause indirect emissions under the General Conformity Rule, and a general conformity determination is not required.

As this analysis was presented in the NPRM, some commenters disagreed with NHTSA's conclusion. One commenter cited two reasons for concluding that the General Conformity Rule applies to NHTSA's action.<sup>3479</sup> First, the commenter argues that NHTSA used "inappropriate modeling" in its analysis. However, this is irrelevant to the agency's analysis, which is based on the Federal regulations and the applicable case law. Second, the commenter asserts that NHTSA "cannot have it both ways" by alleging that it cannot control the technologies that automobile manufacturers would use or consumer purchasing behavior, yet justifies its rulemakings based on consumer purchasing and emissions implications.<sup>3480, 3481</sup> The rulemaking analysis presents a feasible pathway for manufacturers to comply with the rules, based on a series of assumptions about consumer behavior; it is not sufficiently foreseeable to trigger application of the General Conformity Rule. Furthermore, NHTSA cannot directly control these behaviors, and the chain of causation is too attenuated to be responsible for the resulting emissions. Another commenter stated that NHTSA has continuing program responsibility for motor vehicle criteria pollutant emissions because it "retain[s] authority to revise [its] standards in a way that affects future

---

<sup>3479</sup> California *et al.*—Detailed NEPA Comments, Docket No. NHTSA-2017-0069-0625, at 21-22.

<sup>3480</sup> The commenter also quotes *CBD v. NHTSA*, 538 F.3d at 1217, for the proposition that NHTSA's regulations are the proximate cause of the emissions because they allow particular fuel economy levels that "translate directly into particular tailpipe emissions." However, that quote was referencing carbon dioxide emissions, which are predictable based on fuel used. NHTSA can directly regulate fuel economy for passenger cars and light trucks. On the other hand, criteria pollutant emissions are more significantly impacted by VMT, technology choices, and other factors that are not directly within the control of NHTSA.

<sup>3481</sup> See also Joint Submission from the States of California *et al.* and the Cities of Oakland *et al.*, Docket No. NHTSA-2018-0067-11735, at 35.

emission levels.”<sup>3482</sup> However, NHTSA disagrees with this assertion. First, the agency does not have statutory authority to regulate criteria pollutant emissions from motor vehicles. Second, the fact that NHTSA could establish CAFE standards for separate, future motor vehicles does not establish continuing program responsibility over emissions that could result from the vehicles regulated by this action.

NHTSA and EPA further discuss their obligations under the General Conformity Rule, and further address comments received, in Section VI.D.3 above.

### 3. National Historic Preservation Act (NHPA)

The NHPA (54 U.S.C. 300101 *et seq.*) sets forth government policy and procedures regarding “historic properties”—that is, districts, sites, buildings, structures, and objects included on or eligible for the National Register of Historic Places. Section 106 of the NHPA requires Federal agencies to “take into account” the effects of their actions on historic properties.<sup>3483</sup> In the NPRM, the agencies concluded that the NHPA is not applicable to this rulemaking because the promulgation of CAFE and CO<sub>2</sub> emissions standards for light duty vehicles is not the type of activity that has the potential to cause effects on historic properties.

Two commenters wrote that “[c]limate change and air pollution imperil historic properties throughout the country via direct degradation, sea level rise, fire, flood, and other forms of harm.” Therefore, the commenters concluded that NHTSA and EPA must consult with

---

<sup>3482</sup> *Id.*

<sup>3483</sup> Section 106 is now codified at 54 U.S.C. 306108. Implementing regulations for the Section 106 process are located at 36 CFR part 800.

the relevant Federal and State authorities and fully disclose any impacts to historic properties.<sup>3484</sup> However, as this final rule establishes CAFE and CO<sub>2</sub> standards that increase each year for MYs 2021–2026, this action will result in reductions in climate change-related impacts and most air pollutants compared to the absence of regulation. Furthermore, any impacts to particular historic properties that could be related to emissions changes associated with this rulemaking are not reasonably certain to occur, would be *de minimis* in their level of impact if they did occur, and are too attenuated to be attributed directly to this action. (*See also* Section X.E.6 below.) There is no evidence that the changes in air pollution or CO<sub>2</sub> emissions associated with this rulemaking, in and of themselves, would alter the characteristics of a historic property qualifying it for inclusion in or eligibility for the National Register.<sup>3485</sup> Nevertheless, NHTSA includes a brief, qualitative discussion of the impacts of the alternatives on historical and cultural resources in Section 7.3 of the FEIS. For the foregoing reasons, the agencies continue to conclude that any potential impacts have been accounted for in the associated analyses of this rulemaking and that no consultation is required under the NHPA.

#### 4. Fish and Wildlife Conservation Act (FWCA)

The FWCA (16 U.S.C. 2901 *et seq.*) provides financial and technical assistance to States for the development, revision, and implementation of conservation plans and programs for nongame fish and wildlife. In addition, the Act encourages all Federal departments and agencies to utilize their statutory and administrative authorities to conserve and to promote conservation

---

<sup>3484</sup> CARB, Docket No. NHTSA-2018-0067-11873, at 411; California *et. al.*—Detailed NEPA Comments, Docket No. NHTSA-2017-0069-0625, at 30.

<sup>3485</sup> 36 CFR 800.16(i).

of nongame fish and wildlife and their habitats. The agencies conclude that the FWCA is not applicable to this final rule because this rulemaking does not involve the conservation of nongame fish and wildlife and their habitats. NHTSA has, however, conducted a qualitative review in its FEIS of the related direct, indirect, and cumulative impacts, positive or negative, of the alternatives on potentially affected resources, including nongame fish and wildlife and their habitats.

#### 5. Coastal Zone Management Act (CZMA)

The Coastal Zone Management Act (16 U.S.C. 1451 *et seq.*) provides for the preservation, protection, development, and (where possible) restoration and enhancement of the Nation's coastal zone resources. Under the statute, States are provided with funds and technical assistance in developing coastal zone management programs. Each participating State must submit its program to the Secretary of Commerce for approval. Once the program has been approved, any activity of a Federal agency, either within or outside of the coastal zone, that affects any land or water use or natural resource of the coastal zone must be carried out in a manner that is consistent, to the maximum extent practicable, with the enforceable policies of the State's program.<sup>3486</sup>

In the NPRM, the agencies concluded that the CZMA is not applicable to this rulemaking because this rulemaking does not involve an activity within, or outside of, the Nation's coastal zones that affects any land or water use or natural resource of the coastal zone. CARB commented that California's coast is vulnerable to sea level rise from climate change and that the

---

<sup>3486</sup> 16 U.S.C. 1456(c)(1)(A).

proposal would exacerbate that threat. Therefore, the commenter claimed that the proposal violated California's policies and obligations in its management program to preserve, protect, and enhance its coastline.<sup>3487</sup> However, in its FEIS, NHTSA estimates that the sea-level rise in 2100 associated with Alternative 1 (0 percent annual average increase for both passenger cars and light trucks for MYs 2021–2026), the least stringent alternative considered, would be 0.7 mm. Such a level is too small to have any meaningful impact on land or water use or a natural resource of the coastal zone. Furthermore, as this final rule establishes CAFE and CO<sub>2</sub> standards that increase each year for MYs 2021–2026, this action will result in reductions in sea level rise resulting from climate change compared to the absence of regulation. Therefore, the agencies continue to conclude that the CZMA is not applicable to this rulemaking. NHTSA has, however, conducted a qualitative review in its FEIS of the related direct, indirect, and cumulative impacts, positive or negative, of the alternatives on potentially affected resources, including coastal zones.

## 6. Endangered Species Act (ESA)

Under Section 7(a)(2) of the Endangered Species Act (ESA), Federal agencies must ensure that actions they authorize, fund, or carry out are “not likely to jeopardize the continued existence” of any Federally listed threatened or endangered species (collectively, “listed species”) or result in the destruction or adverse modification of the designated critical habitat of these species.<sup>3488</sup> In general, if a Federal agency determines that an agency action may affect a listed species or designated critical habitat, it must initiate consultation with the appropriate

---

<sup>3487</sup> CARB, Docket No. NHTSA-2018-0067-11873, at 411.

<sup>3488</sup> 16 U.S.C. 1536(a)(2).

Service—the U.S. Fish and Wildlife Service (FWS) of the Department of the Interior (DOI) and/or the National Oceanic and Atmospheric Administration’s National Marine Fisheries Service (NMFS) of the Department of Commerce (together, “the Services”), depending on the species involved—in order to ensure that the action is not likely to jeopardize the species or destroy or adversely modify designated critical habitat.<sup>3489</sup> Under this standard, the Federal agency taking action evaluates the possible effects of its action and determines whether to initiate consultation.<sup>3490</sup>

In the NPRM, the agencies noted that they had considered the effects of the proposed standards and alternatives in light of applicable ESA regulations, case law, and guidance to determine what, if any, impact there might be to listed species or designated critical habitat. The agencies also considered the discussion in the DEIS, where NHTSA incorporated by reference its response to a public comment on page 9-101 of the MY 2017–2025 CAFE Standards Final EIS.<sup>3491</sup> Based on that assessment, the agencies determined that the actions of setting CAFE and CO<sub>2</sub> emissions standards did not require consultation under Section 7(a)(2) of the ESA. Accordingly, the agencies wrote that they had concluded their review of this action under Section 7 of the ESA.

---

<sup>3489</sup> See 50 CFR 402.14.

<sup>3490</sup> See 50 CFR 402.14(a) (“Each Federal agency shall review its actions at the earliest possible time to determine whether any action may affect listed species or critical habitat.”).

<sup>3491</sup> For the final rule for MY 2017 and beyond CAFE standards, NHTSA concluded that a Section 7(a)(2) consultation was not required because any potential for a specific impact on particular listed species and their habitats associated with emission changes achieved by that rulemaking were too uncertain and remote to trigger the threshold for such a consultation. In the Draft EIS, NHTSA wrote that this conclusion, based on the discussion and analysis cited, applied equally to the current rulemaking.

Several commenters disagreed with the agencies' assessment. In general, commenters stated that the agencies' proposed action would increase emissions of CO<sub>2</sub> and criteria air pollutants (e.g., nitrogen oxide [NO<sub>x</sub>] and sulfur dioxide [SO<sub>2</sub>]<sup>3492</sup>), that these emissions would have direct or indirect (i.e., through climate change) impacts on listed species and critical habitats, that the threshold for a finding of "may affect" is extremely low, and that the agencies therefore have a duty to consult with the Services under the ESA.<sup>3493</sup>

In light of these comments, the agencies re-evaluated their obligations under the ESA and applicable regulations, case law, and guidance. Ultimately, for the following reasons, the agencies arrive at the same conclusion. Although there is a general association between the actions undertaken in this final rule and environmental impacts, as described in this preamble and the FEIS, the agencies' actions result in no effects on listed species or designated critical habitat and therefore do not require consultation under Section 7(a)(2) of the ESA. Furthermore, the agencies lack sufficient discretion or control to bring these actions under the consultation requirement of the ESA. The agencies' review under the ESA is concluded.

---

<sup>3492</sup> In fact, in Section 4.2.1.1 of NHTSA's FEIS, the agency reports that any of the action alternatives would result in decreased emissions of sulfur dioxide in 2025, 2035, and 2050 compared to the No Action Alternative.

<sup>3493</sup> See Center for Biological Diversity, Earthjustice, Natural Resources Defense Council, and Sierra Club, Docket Nos. NHTSA-2017-0069-0605 and NHTSA-2018-0067-12127; Center for Biological Diversity, Sierra Club, and Public Citizen, Inc., Docket No. NHTSA-2018-0067-12378; Center for Biological Diversity, Earthjustice, Environmental Law and Policy Center, Natural Resources Defense Council, Public Citizen, Inc., Safe Climate Campaign, Sierra Club, Southern Environmental Law Center, and Union of Concerned Scientists, Docket No. NHTSA-2018-0067-12123, at 69; States of California, Connecticut, Delaware, Hawaii, Iowa, Illinois, Maine, Maryland, Minnesota, New Jersey, New Mexico, New York, North Carolina, Oregon, Rhode Island, Vermont, and Washington, the Commonwealths of Massachusetts, Pennsylvania, and Virginia, the District of Columbia, and the Cities of Los Angeles, New York, Oakland, San Francisco, and San Jose, Docket Nos. NHTSA-2018-0067-11735, at 47-48; and California Air Resources Board, Docket Nos. NHTSA-2018-0067-11873, at 411.

a) *The Agencies' Actions Have No Effects on Listed Species or Critical Habitat and Do Not Trigger ESA Consultation*

Commenters have stated that CO<sub>2</sub> and criteria air pollutant emissions are relevant to Section 7(a)(2) consultation because of the potential impacts of climate change or the pollutants themselves on listed species or critical habitat. The agencies have considered the potential impacts of this action to listed species or designated critical habitat of these species and conclude that any such impacts cannot be attributed to the agencies' actions (e.g., they are too uncertain and attenuated). Because the agencies conclude there are "no effects," Section 7(a)(2) consultation is not required. The agencies base this conclusion both on the language of the Section 7(a)(2) implementing regulations and on the long history of actions and guidance provided by DOI.

The Section 7(a)(2) implementing regulations require consultation if a Federal agency determines its action "may affect" listed species or critical habitat.<sup>3494</sup> The recently revised regulations define "effects of the action" as "all consequences to listed species or critical habitat that are caused by the proposed action, including the consequences of other activities that are caused by the proposed action. A consequence is caused by the proposed action if it would not occur *but for* the proposed action and it is *reasonably certain to occur*."<sup>3495</sup> The revised definition made explicit a "but for" test and the concept of "reasonably certain to occur" for all

---

<sup>3494</sup> 50 CFR 402.14(a). The Services recently issued a final rule revising the regulations governing the ESA Section 7 consultation process. 84 FR 44976 (Aug. 27, 2019). The effective date of the new regulations was subsequently delayed to October 28, 2019. 84 FR 50333 (Sep. 25, 2019). As discussed in the text that follows, the agencies believe that their conclusion would be the same under both the current and prior regulations.

<sup>3495</sup> 50 CFR 402.02 (emphasis added), as amended by 84 FR 44976, 45016 (Aug. 27, 2019).

effects.<sup>3496</sup> However, in the preamble to the final rule, the Services emphasized that the “but for” test and “reasonably certain to occur” are not new or heightened standards.<sup>3497</sup> In this context, “‘but for’ causation means that the consequence in question would not occur if the proposed action did not go forward . . . . In other words, if the agency fails to take the proposed action and the activity would still occur, there is no ‘but for’ causation. In that event, the activity would not be considered an effect of the action under consultation.”<sup>3498</sup>

The revised ESA regulations also provide a framework for determining whether consequences are caused by a proposed action and are therefore “effects” that may trigger consultation. The regulations provide in part:

To be considered an effect of a proposed action, a consequence must be caused by the proposed action (*i.e.*, the consequence would not occur but for the proposed action and is reasonably certain to occur). A conclusion of reasonably certain to occur must be based on clear and substantial information, using the best scientific and commercial data available. Considerations for determining that a consequence to the species or critical habitat is not caused by the proposed action include, but are not limited to:

(1) The consequence is so remote in time from the action under consultation that it is not reasonably certain to occur; or

(2) The consequence is so geographically remote from the immediate area involved in the action that it is not reasonably certain to occur; or

---

<sup>3496</sup> The Services’ prior regulations defined “effects of the action” in relevant part as “the direct and indirect effects of an action on the species or critical habitat, together with the effects of other activities that are interrelated or interdependent with that action, that will be added to the environmental baseline.” 50 CFR 402.02 (as in effect prior to Oct. 28, 2019). Indirect effects were defined as “those that are caused by the proposed action and are later in time, but still are reasonably certain to occur.” *Id.*

<sup>3497</sup> 84 FR at 44977 (“As discussed in the proposed rule, the Services have applied the ‘but for’ test to determine causation for decades. That is, we have looked at the consequences of an action and used the causation standard of ‘but for’ plus an element of foreseeability (*i.e.*, reasonably certain to occur) to determine whether the consequence was caused by the action under consultation.”).

<sup>3498</sup> *Id.* We note that as the Services do not consider this to be a change in their longstanding application of the ESA, this interpretation applies equally under the prior regulations (which were effective through October 28, 2019, and the current regulations).

(3) The consequence is only reached through a lengthy causal chain that involves so many steps as to make the consequence not reasonably certain to occur.<sup>3499</sup>

The regulations go on to make clear that the action agency must factor these considerations into its assessments of potential effects.<sup>3500</sup>

DOI, the agency charged with co-administering the ESA, previously evaluated whether CO<sub>2</sub> emissions associated with a specific proposed Federal action triggered ESA Section 7(a)(2) consultation. The agencies have reviewed the long history of actions and guidance provided by DOI. To that point, the agencies incorporate by reference Appendix G of the MY 2012-2016 CAFE standards EIS.<sup>3501</sup> That analysis relied on the significant legal and technical analysis undertaken by FWS and DOI. Specifically, NHTSA looked at the history of the Polar Bear Special Rule and several guidance memoranda provided by FWS and the U.S. Geological Survey. Ultimately, DOI concluded that a causal link could not be made between CO<sub>2</sub> emissions associated with a proposed Federal action and specific effects on listed species; therefore, no Section 7(a)(2) consultation would be required.

Subsequent to the publication of that Appendix, a court vacated the Polar Bear Special Rule on NEPA grounds, though it upheld the ESA analysis as having a rational basis.<sup>3502</sup> FWS then issued a revised Final Special Rule for the Polar Bear.<sup>3503</sup> In that final rule, FWS provided

---

<sup>3499</sup> 50 CFR 402.17(b).

<sup>3500</sup> 50 CFR 402.17(c) (“*Required consideration.* The provisions in paragraphs (a) and (b) of this section must be considered by the action agency and the Services.”).

<sup>3501</sup> Available on NHTSA’s Corporate Average Fuel Economy website at <https://one.nhtsa.gov/Laws-&-Regulations/CAFE-%E2%80%93-Fuel-Economy/Final-EIS-for-CAFE-Passenger-Cars-and-Light-Trucks,-Model-Years-2012%E2%80%932016>.

<sup>3502</sup> *In re: Polar Bear Endangered Species Act Listing and Section 4(D) Rule Litigation*, 818 F.Supp.2d 214 (D.D.C. Oct. 17, 2011).

<sup>3503</sup> 78 FR 11766 (Feb. 20, 2013).

that for ESA Section 7, the determination of whether consultation is triggered is narrow and focused on the discrete effect of the proposed agency action. FWS wrote, “[T]he consultation requirement is triggered only if there is a causal connection between the proposed action and a discernible effect to the species or critical habitat that is reasonably certain to occur. One must be able to ‘connect the dots’ between an effect of a proposed action and an impact to the species and there must be a reasonable certainty that the effect will occur.”<sup>3504</sup> The statement in the revised Final Special Rule is consistent with the prior guidance published by FWS and remains valid today.<sup>3505</sup> Likewise, the current regulations identify remoteness in time, geography, and the causal chain as factors to be considered in assessing whether a consequence is “reasonably certain to occur.” If the consequence is not reasonably certain to occur, it is not an “effect of a proposed action” and does not trigger the consultation requirement.

The agencies’ actions establishing CAFE and CO<sub>2</sub> standards for passenger cars and light trucks do not directly affect listed species or critical habitat. The regulations promulgated by the agencies are used to calculate average standards for manufacturers based on the vehicles they produce for sale in the United States. Any potential effects of this action on listed species or designated critical habitat would be a result of changes to CO<sub>2</sub> or air pollutant emissions that are caused by the individual choices of manufacturers in producing these vehicles and of consumers in purchasing and operating those vehicles. The agencies are not requiring, authorizing, funding, or carrying out the operation of motor vehicles (i.e., the proximate cause of downstream

<sup>3504</sup> 78 FR at 11784-11785.

<sup>3505</sup> See DOI Solicitor’s Opinion No. M-37017, “Guidance on the Applicability of the Endangered Species Act Consultation Requirements to Proposed Actions Involving the Emissions of Greenhouse Gases” (Oct. 3, 2008).

emissions), the production or refining of fuel (i.e., a proximate cause of upstream emissions),<sup>3506</sup> the use of any land that is critical habitat for any purpose, or the taking of any listed species or other activity that may affect any listed species. Ultimately, the relevant decisions that result in emissions are taken by third parties, and any on-the-ground activities to implement and carry out those decisions are undertaken by such third parties. These decisions are influenced by a complex series of market factors that, though influenced by the agencies' actions, independently could result in the same series of decisions by consumers that commenters attribute to the agencies' actions (such as increased VMT and therefore increased emissions). This complex and lengthy chain of causality, which is highly dependent on market factors and therefore uncertain, leads the agencies to conclude that the resulting impacts of their actions to listed species or critical habitat do not satisfy the "but for" test or are "reasonably certain to occur."

With regard to climate change, EPA and NHTSA are not able to make a causal link for purposes of Section 7(a)(2) that would "connect the dots" between their actions, vehicle emissions from motor vehicles affected by their actions, climate change, and particular impacts to listed species or critical habitats. The agencies' actions are to set standards that are effectively footprint curves, which are used as part of a complex calculation based on the vehicles produced by manufacturers for sale in the United States to determine a corporate average standard for each manufacturer. This approach, dictated by the Federal statute, gives manufacturers significant discretion to design, produce, and sell motor vehicles to meet consumer demand. Because

---

<sup>3506</sup> The agencies note that upstream emissions sources, such as oil extraction sites and fuel refineries, remain subject to the ESA. As future non-federal activities become reasonably certain, Section 7 and/or other sections of the ESA may provide protection for listed species and designated critical habitats. For example, new oil exploration or extraction activity may result in permitting or construction activities that would trigger consultation or other activities for the protection of listed species or designated critical habitat, as impacts may be more direct and more certain to occur.

manufacturers could choose to produce more vehicles with larger footprints (and therefore less stringent standards), fleet-average CO<sub>2</sub> emissions could increase to some extent year-over-year independently of where the agencies set standards. Or the opposite may be true, and a shift in consumer preferences could lead to increased production of vehicles with smaller footprints (and therefore more stringent standards), resulting in overall declines in CO<sub>2</sub> emissions in the future compared to what the agencies are forecasting. Importantly, consumers not only choose which vehicles to purchase across a range of available fuel economies, they also choose how much to operate those vehicles (and therefore the quantity of fuel used and CO<sub>2</sub> emitted) independently of any action undertaken by the agencies.<sup>3507, 3508</sup>

Even with so many third parties in the causal chain making independent choices influenced by independent factors, the mechanics of climate change further break the chain of causality between the agencies' actions and specific effects on listed species or designated critical habitat. Climate change is a global phenomenon, impacted by greenhouse gas emissions that could occur anywhere throughout the world. As these gases accumulate in the atmosphere, radiative forcing increases, resulting in various potential impacts to the global climate system (e.g., warming temperatures, droughts, and changes in ocean pH) over long time scales. These changes could directly or indirectly impact listed species and/or designated critical habitat over time. Although this is a simplified explanation of a complex phenomenon subject to a significant degree of scientific study, it illustrates that the potential climate change-related consequences of

---

<sup>3507</sup> While VMT is affected by the cost of driving associated with fuel economy (i.e., the rebound effect), it is also affected by several market factors, such as economic conditions, that are far beyond the agencies' control and arguably have a greater influence than this rulemaking.

<sup>3508</sup> The fact that overall CO<sub>2</sub> emissions are influenced so heavily by consumer preferences and behavior further supports the agencies' conclusion that impacts are not "reasonably certain to occur."

this rulemaking on listed species and designated critical habitat are not “reasonably certain to occur” under any of the three tests in the ESA regulations and listed above. Not only are the consequences to listed species or designated critical habitat geographically and temporally remote from the emissions that result from regulated vehicles, the chain of causality is simply too lengthy and complex. Because impacts to listed species and designated critical habitat result from climate shifts that, in and of themselves, result from the accumulation over time of greenhouse gas emissions from anywhere in the world, there is simply no way to “connect the dots” between the emissions from a regulated vehicle and those impacts. While the potential impacts of climate change have been well-documented, there is no degree of certainty that this action (as distinct from any other source of CO<sub>2</sub> emissions) would be the cause of any particular impact to listed species or critical habitats. Because greenhouse gas emissions continue to occur from other sectors within the U.S. and from other sources globally, there is simply no scientific way to apportion any impact to a listed species or designated critical habitat to the agencies’ actions.<sup>3509</sup>

One comment to the NPRM documented the potential impacts of climate change on Federally protected species and included a five-page table of species listed during 2006 to 2015 for which the commenters claim climate change was a listing factor.<sup>3510</sup> This conflates the requirements of ESA Section 4 (governing ESA listing) and ESA Section 7 (addressing the obligations of Federal agencies). Section 4 requires FWS or NMFS to assess all threats to species regardless of the origin of those threats. 16 U.S.C. 1533(a)(1). In contrast, the focus of

---

<sup>3509</sup> See 50 CFR 402.17(b) (“A conclusion of reasonably certain to occur must be based on clear and substantial information, using the best scientific and commercial data available.”)

<sup>3510</sup> Center for Biological Diversity, Sierra Club, and Public Citizen, Inc., Docket No. NHTSA-2018-0067-12378, at 25-30.

Section 7(a)(2) is narrower and requires agencies to assess only effects on species that are attributable to the specific agency action. 16 U.S.C. 1536(a)(2). That climate change was considered as a factor in a determination to list a species does not speak to the separate inquiry of whether the specific agency action is impacting a listed species. Here, the agencies believe this comment inappropriately attributes the entire issue of climate change, including all CO<sub>2</sub> emissions no matter which sector generated them, to NHTSA and EPA's actions. In fact, NHTSA and EPA's actions would have only very small impacts on climate attributes, such as average temperatures, precipitation, and sea-level rise. The likelihood that these very small impacts, which are described above and in NHTSA's FEIS, would jeopardize listed species or adversely modify designated critical habitat is simply too remote to be cognizable under the ESA consultation requirements.<sup>3511</sup> The fact that the agencies would exacerbate the impacts of climate change to a very small degree is not enough to determine that impacts on listed species or designated critical habitat are reasonably certain to occur.<sup>3512, 3513</sup>

As noted above, for consultation to be required, there must exist a sufficient nexus between the agency activity and the impact on listed species that the ESA intends to avoid. The Services have defined that nexus as "but for" causation. However, there is no "but for" causation associated with this final rule as the impacts of climate change will occur regardless of this

---

<sup>3511</sup> *Ground Zero Center for Non-Violent Action v. U.S. Dept. of Navy*, 383 F.3d 1082 (2004).

<sup>3512</sup> Such a broad interpretation of the ESA would ensnare every Federal action that resulted in even an additional ounce of additional carbon dioxide emissions into the Section 7(a)(2) consultation process. *See, e.g.*, 78 FR 11766, 11785 (Feb. 20, 2013) ("Without the requirement of a causal connection between the action under consultation and effects to species, literally every agency action that contributes CO<sub>2</sub> emissions to the atmosphere would arguably result in consultation with respect to every listed species that may be affected by climate change.").

<sup>3513</sup> The agencies also disagree that, for purposes of compliance with the ESA, this action would exacerbate climate change impacts on listed species or critical habitat. This final rule establishes CAFE and CO<sub>2</sub> standards that increase in stringency on a year-by-year basis. While these standards are less stringent than the standards considered and set forth in the 2012 rulemaking, the ESA does not serve as a one-way ratchet when agencies use their inherent authority to reconsider decisions that have not yet taken effect.

action. In fact, even if the agencies were to set CAFE and CO<sub>2</sub> standards at levels that would eliminate all CO<sub>2</sub> emissions from motor vehicles made available for sale in the United States, the impacts of climate change are still projected to occur due to emissions from other sectors in the United States and other sources globally. Changes to tailpipe greenhouse gas emissions or associated upstream emissions related to this rulemaking and the alternatives considered would be very small compared to global CO<sub>2</sub> emissions, which would continue. The agencies also note that because third parties (as described above) undertake most of the decisions that result in emissions, increased greenhouse gas emissions could occur regardless of the agencies' actions in this final rule. This further demonstrates the lack of "but for" causality in this case.

Criteria air pollutant emissions from passenger cars and light trucks differ from greenhouse gas emissions in many ways. Most significantly, because passenger cars and light trucks are subject to gram-per-mile emissions standards for criteria pollutants, more fuel-efficient (and, correspondingly, less CO<sub>2</sub>-intensive) vehicles are not necessarily, from the standpoint of air quality, "cleaner" vehicles. Therefore, to the extent that CAFE and CO<sub>2</sub> standards lead to changes in overall quantities of vehicular emissions that impact air quality, these are dominated by induced changes in highway travel. Changes in overall fuel consumption do lead to changes in emissions from "upstream" processes involved in supplying fuel to vehicles. Depending on how total vehicular emissions and total upstream emissions change in response to less stringent standards, overall emissions could increase or decrease.

While small in magnitude, net impacts could also vary considerably among different geographic areas depending on the locations of upstream emission sources and where changes in highway travel occur. This is important because of another significant difference between criteria air pollutant emissions and greenhouse gas emissions: criteria air pollutant emissions are

localized<sup>3514</sup> whereas CO<sub>2</sub> emissions contribute to global atmospheric concentrations and climate change no matter where they occur. As reported in Section 4.1.1 of the FEIS, concentrations of many air pollutants emitted from motor vehicles are elevated in ambient air within approximately 1,000 to 2,000 feet of major roadways. With meteorological conditions that tend to inhibit the dispersion of emissions, concentrations of traffic-generated air pollutants can be elevated for as much as about 8,500 feet downwind of roads.<sup>3515, 3516</sup> But this means that impacts of criteria pollutant emissions are dependent on where they occur, to a degree much more significant than greenhouse gas emissions. Although the agencies anticipate increased fuel use as a result of this final rule (compared to the standards described in the 2012 final rule),<sup>3517</sup> NHTSA and EPA have no way to know with reasonable certainty where additional fuel extraction and refining will occur. The agencies also cannot calculate with reasonable certainty where changes in highway travel will occur, as those impacts may not be uniform across the country. In fact, changes in land use patterns could exacerbate or reduce criteria pollutant emissions in any particular area, and such local changes are more uncertain. Therefore, even with the best scientific and commercial data available, the agencies cannot draw conclusions on impacts on particular listed species or designated critical habitat.

---

<sup>3514</sup> Criteria pollutant emissions contribute to local, regional, cross-state, and cross-national air pollution. Ultimately, however, the physical distance impacted by the pollutants is much smaller than for CO<sub>2</sub> emissions, which affect the global atmosphere.

<sup>3515</sup> Hu, S., S. Fruin, K. Kozawa, S. Mara, S.E. Paulson, and A.M. Winer. *A Wide Area of Air Pollutant Impact Downwind of a Freeway during Pre-sunrise Hours*. *Atmospheric Environment*. 43(16):2541–49 (2009). doi:10.1016/j.atmosenv.2009.02.033.

<sup>3516</sup> Hu, S., S.E. Paulson, S. Fruin, K. Kozawa, S. Mara, and A.M. Winer. *Observation of Elevated Air Pollutant Concentrations in a Residential Neighborhood of Los Angeles California Using a Mobile Platform*. *Atmospheric Environment*. 51:311–319 (2012). doi:10.1016/j.atmosenv.2011.12.055. Available at: <http://europepmc.org/backend/ptpmrender.fcgi?accid=PMC3755476&blobtype=pdf>.

<sup>3517</sup> Although, again, the agencies note that average fleet-wide fuel economy is projected to improve under any of the alternatives considered in this action.

In short, the impacts of CAFE and CO<sub>2</sub> standards on criteria pollutant emissions is indirect, and the impacts on air quality at any particular location (such as where a listed species or designated critical habitat is located) are more ambiguous than for global atmospheric concentrations of CO<sub>2</sub> over the long term. Therefore, the agencies reach the same conclusion for criteria pollutant emissions as for CO<sub>2</sub> emissions and climate change. For example, the causal chain between the agencies' actions and any impacts to listed species or designated critical habitat is attenuated by the fact that independent third parties must choose not only how much to operate their motor vehicles, but where to operate those motor vehicles as well. And the agencies cannot meaningfully conclude that any impact to a listed species and designated critical habitat would be caused by criteria pollutant emissions from the vehicles regulated by this rule rather than by another source. Finally, the impacts on criteria pollutant emissions as a result of this rule, especially in light of other emissions sources besides the regulated vehicles, are small<sup>3518</sup> and the likelihood of jeopardy or the adverse modification of designated critical habitat is too remote. Current modeling tools available are not designed to trace fluctuations in ambient concentration levels of criteria and toxic air pollutants to potential impacts on particular endangered species. The agencies therefore cannot conclude that impacts are “reasonably certain to occur.”<sup>3519</sup>

Finally, the agencies also note the potential uncertainty related to changes in total air pollutant and CO<sub>2</sub> emissions as a result of the flexibilities in the CAFE and CO<sub>2</sub> programs. Both programs allow manufacturers to trade and apply credits that have been earned from over-

---

<sup>3518</sup> For more information, see Chapter 4 of the FEIS.

<sup>3519</sup> See 50 CFR 402.17 (“A conclusion of reasonably certain to occur must be based on clear and substantial information, using the best scientific and commercial data available”).

compliance in lieu of meeting the applicable standards for a particular model year, and manufacturers may have planned to rely on credits to comply with the standards for the model years regulated by this action. This could offset any changes in emissions that would result from the agencies' final decision. Furthermore, NHTSA's CAFE program allows manufacturers to pay civil penalties to cover any shortfall in compliance, further offsetting potential improvements in fuel economy (and, therefore, changes in air pollutant and CO<sub>2</sub> emissions) that might have occurred under the aугural standards. The existence of these flexibilities further supports the agencies' conclusion that they can establish neither "but for" causation nor a reasonable certainty that impacts will occur on listed species or designated critical habitat.

The agencies have considered this analysis and conclude that any consequence to specific listed species or designated critical habitats from climate change or other air pollutant emissions is too remote and uncertain to be attributable to the agencies' actions here. These consequences are not "effects" for purposes of consultation under Section 7(a)(2). NHTSA and EPA therefore conclude that this final rule has no effect on listed species or their critical habitats.

*b) The Agencies Lack Sufficient Discretion or Control to Bring These Actions under the Consultation Requirement of the ESA*

The primary purpose of EPCA, as amended by EISA, and codified at 49 U.S.C. chapter 329, is energy conservation, and NHTSA is statutorily obligated to set attribute-based CAFE standards for each model year at the levels it determines are "maximum feasible."<sup>3520</sup> But

---

<sup>3520</sup> See 49 U.S.C. 32902(a) ("At least 18 months before the beginning of each model year, the Secretary of Transportation shall prescribe by regulation average fuel economy standards for automobiles manufactured by a

“maximum feasible” is a balancing of several factors, and Congress clearly did not envision that the CAFE program would “solve” energy conservation in a single rulemaking action.<sup>3521</sup> Fuel economy standards have the related benefit of reducing CO<sub>2</sub> emissions, and may also result in reduced emissions of many criteria air pollutants. Similarly, EPA has found that the elevated concentrations of greenhouse gases in the atmosphere may reasonably be anticipated to endanger public health and welfare. As a result of these findings, CAA section 202(a) requires the agency to issue standards applicable to emissions of such gases from motor vehicles. Although not a statutory requirement, EPA has given weight to the policy goal of establishing CO<sub>2</sub> standards that are coordinated with NHTSA’s CAFE standards.<sup>3522</sup>

As previously indicated, commenters assert that CO<sub>2</sub> and criteria air pollutant emissions are relevant to Section 7(a)(2) consultation because of the potential impacts of climate change or the pollutants themselves on listed species or designated critical habitat. However, it is not clear whether their comments are based on the fact that the agencies predict increases in CO<sub>2</sub> emissions and most criteria pollutant emissions under all action alternatives compared to the MY 2022-2025 CO<sub>2</sub> and augural CAFE standards, or the fact that *any* emissions from passenger cars or light trucks will continue under any of the alternatives considered.

With regard to the latter, NHTSA does not interpret EPCA/EISA to mean that Congress expected the CAFE program to take the U.S. auto fleet off of oil entirely—indeed, EISA renders

---

manufacturer in that model year. Each standard shall be the maximum feasible average fuel economy level that the Secretary decides the manufacturers can achieve in that model year.”).

<sup>3521</sup> See, e.g., 49 U.S.C. 32902(b)(2) (setting separate requirements for CAFE standards for MYs 2011 through 2020 and MYs 2021 through 2030).

<sup>3522</sup> See *Mass. v. EPA*, 549 U.S. 497, 532 (2007) (“...there is no reason to think the two agencies cannot both administer their obligations and yet avoid inconsistency.”)

doing so impossible because it amended EPCA to prohibit NHTSA from considering the fuel economy of dedicated alternative fuel vehicles, including electric vehicles, when setting maximum feasible standards. This means that standards cannot be set that assume increased usage of full electrification for compliance. As a result, no matter the level at which NHTSA sets CAFE standards in accordance with EPCA, CO<sub>2</sub> and criteria pollutant emissions will continue. So long as NHTSA's obligation to set CAFE standards remains in place, it is reasonable to assume that Congress's expectation for EPA, in coordinating with NHTSA, is similar.

The purpose of Section 7(a)(2) consultation is to ensure that Federal agencies are not undertaking, funding, permitting, or authorizing actions that are likely to jeopardize the continued existence of listed species or destroy or adversely modify designated critical habitat. However, no matter what standards the agencies set under the CAFE and CO<sub>2</sub> programs, Americans will continue to drive. Neither NHTSA nor EPA has authority to control vehicle miles traveled. As long as there is driving, there will be emissions—whether from vehicle tailpipes or from the stationary sources that create the energy that the vehicles consume. Moreover, both agencies have concluded that significant further electrification of the fleet is not practicable at this time due to concerns about consumer acceptance in a time of foreseeably low fuel prices. The fact that CO<sub>2</sub> and criteria pollutant emissions will continue after NHTSA and EPA actions on standards cannot, alone, trigger Section 7(a)(2) consultation as the agencies lack the discretion or control over these emissions to simply regulate them away entirely in this

action.<sup>3523</sup> Consultation is not required where an agency lacks discretion to take action that will inure to the benefit of listed species.<sup>3524</sup> Since elimination of oil from the fleet is inconsistent with the agencies' statutory authorities and the clear intent of Congress, consultation is not triggered under this scenario.

Commenters may instead be referring to the *trend* in CO<sub>2</sub> and criteria air pollutant emissions under the action alternatives considered in this rulemaking (e.g., whether and by how much emissions increase or decrease). To that point, all of the action alternatives considered result in increases in CO<sub>2</sub> and most criteria air pollutant emissions compared to the standards considered and set forth in the 2012 rulemaking. However, the agencies do not believe this is the relevant comparison for purposes of determining the applicability of Section 7 of the ESA to this action. Model years 2021 through 2026, for the most part, have not yet arrived. So it is not appropriate to compare the current action to a prior action that has not been implemented and which the agencies are reconsidering. When compared to standards through MY 2020, under any of the alternatives considered, fuel economy will improve and CO<sub>2</sub> and most criteria pollutant emissions will decrease over time, either as stringency increases or from the turnover in the fleet to newer, cleaner vehicles.

As detailed above, however, there is no way to meaningfully differentiate between the alternatives in terms of outcomes for listed species and designated critical habitat. The agencies

---

<sup>3523</sup> *National Ass'n of Home Builders v. Defenders of Wildlife*, 551 U.S. 644, 673 (2007) ("Applying *Chevron*, we defer to the Agency's reasonable interpretation of ESA [section] 7(a)(2) as applying only to 'actions in which there is discretionary Federal involvement or control.'" (quoting 50 CFR 402.03)).

<sup>3524</sup> *Id.*; *Sierra Club v. Babbitt*, 65 F.3d 1502, 1509 (9th Cir. 1995) (ESA Section 7(a)(2) consultation is not required where an agency lacks discretion to influence private conduct in a manner that will inure to the benefit of listed species).

cannot reasonably calculate how incrementally less emissions resulting from more stringent standards would benefit those species or habitats; rather, at most, the agencies can only posit that more stringent standards hypothetically could lead to better outcomes. But where to draw any line in terms of impacts to species and habitats is an impossible exercise. Yet, as noted above, NHTSA is mandated by Congress to set “maximum feasible” standards and EPA’s mission is to protect public health and welfare. Under these circumstances, where the agencies must issue standards pursuant to statutory mandate that under any scenario will involve emissions, yet they lack the commensurate ability to take action that will inure to the benefit of species in any meaningful way, Section 7(a)(2) consultation is not required.

Finally, regardless of the level of stringency at which the agencies set CAFE and CO<sub>2</sub> standards, criteria pollutant and CO<sub>2</sub> emissions from motor vehicles will change to a greater or lesser degree because of several independent factors. Because of the complex relationships between fuel economy, vehicle sales, driver behavior (e.g., VMT and driving location), and technology choices by manufacturers, emissions will never uniformly increase or decrease for all future model years, across all regulated pollutants, and in all locations throughout the country. For example, increased stringency may result in greater VMT, resulting in larger downstream emissions of some criteria pollutants. On the other hand, decreased stringency may result in greater fuel refining, result in larger upstream emissions of some pollutants. Because vehicle operation and refinery activity depends upon independent market forces, impacts to particular listed species or designated critical habitat are dependent upon where vehicle operation or increased fuel refining occur, but neither agency can control such decisions. Regardless of whether NHTSA and EPA engage in Section 7(a)(2) consultation, the agencies lack the control necessary to negate all emissions increases in whatever years and locations they occur (e.g.,

ensure ideal technology choices by manufacturers, control consumer purchasing behavior, or regulate driving locations or VMT), or otherwise mitigate impacts associated with these particular emissions. But setting stringency is, in fact, what the agencies are statutorily obligated to do.

For the foregoing reasons, NHTSA and EPA conclude that they lack sufficient discretion or control to bring these actions under the consultation requirement of the ESA.

#### 7. Floodplain Management (Executive Order 11988 and DOT Order 5650.2)

These Orders require Federal agencies to avoid the long- and short-term adverse impacts associated with the occupancy and modification of floodplains, and to restore and preserve the natural and beneficial values served by floodplains. Executive Order 11988 also directs agencies to minimize the impact of floods on human safety, health, and welfare, and to restore and preserve the natural and beneficial values served by floodplains through evaluating the potential effects of any actions the agency may take in a floodplain and ensuring that its program planning and budget requests reflect consideration of flood hazards and floodplain management. DOT Order 5650.2 sets forth DOT policies and procedures for implementing Executive Order 11988. The DOT Order requires that the agency determine if a proposed action is within the limits of a base floodplain, meaning it is encroaching on the floodplain, and whether this encroachment is significant. If significant, the agency is required to conduct further analysis of the proposed action and any practicable alternatives. If a practicable alternative avoids floodplain encroachment, then the agency is required to implement it.

In this rulemaking, the agencies are not occupying, modifying and/or encroaching on floodplains. The agencies, therefore, conclude that the Orders are not applicable to this action.

NHTSA has, however, conducted a review of the alternatives on potentially affected resources, including floodplains, in its FEIS.

8. Preservation of the Nation's Wetlands (Executive Order 11990 and DOT Order 5660.1a)

These Orders require Federal agencies to avoid, to the extent possible, undertaking or providing assistance for new construction located in wetlands unless the agency head finds that there is no practicable alternative to such construction and that the proposed action includes all practicable measures to minimize harm to wetlands that may result from such use. Executive Order 11990 also directs agencies to take action to minimize the destruction, loss, or degradation of wetlands in “conducting Federal activities and programs affecting land use, including but not limited to water and related land resources planning, regulating, and licensing activities.” DOT Order 5660.1a sets forth DOT policy for interpreting Executive Order 11990 and requires that transportation projects “located in or having an impact on wetlands” should be conducted to assure protection of the Nation's wetlands. If a project does have a significant impact on wetlands, an EIS must be prepared.

In the NPRM, the agencies noted that they are not undertaking or providing assistance for new construction located in wetlands. The agencies, therefore, concluded that these Orders do not apply to this rulemaking. One commenter disagreed with this conclusion, noting the potential land use impacts of the rule and the agencies' obligation to consider all factors relevant

to the proposal's effect on the survival and quality of wetlands.<sup>3525</sup> The agencies do not believe that it is feasible to establish the requisite causal chain between the impacts of this action and impacts on wetlands, nor would such impacts be reasonably foreseeable as a direct or indirect result of this rulemaking. The agencies therefore continue to conclude that these Orders do not apply to this rulemaking. Regardless, NHTSA addresses the potential effects of the alternatives on resources, including wetlands, in its FEIS.

9. Migratory Bird Treaty Act (MBTA), Bald and Golden Eagle Protection Act (BGEPA), Executive Order 13186

The MBTA (16 U.S.C. 703–712) provides for the protection of certain migratory birds by making it illegal for anyone to “pursue, hunt, take, capture, kill, attempt to take, capture, or kill, possess, offer for sale, sell, offer to barter, barter, offer to purchase, purchase, deliver for shipment, ship, export, import, cause to be shipped, exported, or imported, deliver for transportation, transport or cause to be transported, carry or cause to be carried, or receive for shipment, transportation, carriage, or export” any migratory bird covered under the statute.<sup>3526</sup>

The BGEPA (16 U.S.C. 668-668d) makes it illegal to “take, possess, sell, purchase, barter, offer to sell, purchase or barter, transport, export or import” any bald or golden eagles.<sup>3527</sup> Executive Order 13186, “Responsibilities of Federal Agencies to Protect Migratory Birds,” helps to further the purposes of the MBTA by requiring a Federal agency to develop a Memorandum

---

<sup>3525</sup> Joint Submission from the States of California *et al.* and the Cities of Oakland *et al.*, Docket No. NHTSA-2018-0067-11735, at 46-47.

<sup>3526</sup> 16 U.S.C. 703(a).

<sup>3527</sup> 16 U.S.C. 668(a).

of Understanding (MOU) with the Fish and Wildlife Service when it is taking an action that has (or is likely to have) a measurable negative impact on migratory bird populations.

The agencies conclude that the MBTA, BGEPA, and Executive Order 13186 do not apply to this action because there is no disturbance, take, measurable negative impact, or other covered activity involving migratory birds or bald or golden eagles involved in this rulemaking.

10. Department of Transportation Act (Section 4(f))

Section 4(f) of the Department of Transportation Act of 1966 (49 U.S.C. 303), as amended, is designed to preserve publicly owned park and recreation lands, waterfowl and wildlife refuges, and historic sites. Specifically, Section 4(f) provides that DOT agencies cannot approve a transportation program or project that requires the use of any publicly owned land from a public park, recreation area, or wildlife or waterfowl refuge of national, State, or local significance, or any land from a historic site of national, State, or local significance, unless a determination is made that:

(1) There is no feasible and prudent alternative to the use of land, and

(2) The program or project includes all possible planning to minimize harm to the property resulting from the use.

These requirements may be satisfied if the transportation use of a Section 4(f) property results in a de minimis impact on the area.

NHTSA concludes that Section 4(f) is not applicable to this action because this rulemaking is not an approval of a transportation program or project that requires the use of any publicly owned land.

11. Executive Order 12898: “Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations”

Executive Order 12898 (59 FR 7629 (Feb. 16, 1994)) establishes Federal executive policy on environmental justice. It directs Federal agencies, to the greatest extent practicable and permitted by law, to make environmental justice part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority and low-income populations in the United States. DOT Order 5610.2(a)<sup>3528</sup> sets forth the Department of Transportation’s policy to consider environmental justice principles in all its programs, policies, and activities.

Environmental justice is a principle asserting that all people deserve fair treatment and meaningful involvement with respect to environmental laws, regulations, and policies. EPA seeks to provide the same degree of protection from environmental health hazards for all people. DOT shares this goal and is informed about the potential environmental impacts of its rulemakings through the NEPA process. One comment on the NPRM claimed that the agencies “failed to recognize the benefits of the existing standards” for disadvantaged communities. Specifically, the commenter claimed that the agencies did not provide an underlying analysis of

---

<sup>3528</sup> Department of Transportation Updated Environmental Justice Order 5610.2(a), 77 FR 27534 (May 10, 2012).

environmental justice issues and thereby failed to meet the requirements of EO 12898.<sup>3529</sup>

However, the agencies addressed their obligations under EO 12898 in the preamble to the NPRM and in Section 7.5 of the DEIS. The agencies received a number of comments regarding the analysis it presented. NHTSA responds to those comments in Section 10.7 of the FEIS, and the agencies have revised their environmental justice analysis based on the information contained in those comments. The revised analysis is presented here and in the FEIS.

There is evidence that proximity to oil refineries could be correlated with incidences of cancer and leukemia.<sup>3530, 3531, 3532</sup> Proximity to high-traffic roadways could result in adverse cardiovascular and respiratory impacts, among other possible impacts.<sup>3533, 3534, 3535, 3536, 3537, 3538,</sup>

<sup>3539</sup> Climate change affects overall global temperatures, which could, in turn, affect the number and severity of outbreaks of vector-borne illnesses.<sup>3540, 3541</sup> In the context of this rulemaking, the environmental justice concern is the extent to which minority and low-income populations could be more exposed or vulnerable to such environmental and health impacts.

Numerous studies have found that some environmental hazards are more prevalent in areas where racial/ethnic minorities and people with low socioeconomic status represent a higher proportion of the population compared with the general population. In addition, compared to non-Hispanic whites, some subpopulations defined by race and ethnicity have been shown to have a greater incidence of some health conditions during certain life stages. For example, in 2014, about 13 percent of Black, non-Hispanic and 24 percent of Puerto Rican children were estimated to have asthma, compared with 8 percent of white, non-Hispanic children.<sup>3542</sup> The agencies have therefore considered areas nationwide that could contain minority and low-income communities who would most likely be exposed to the environmental and health impacts of oil production, distribution, and consumption or the potential impacts of climate change. These include areas where oil production and refining occur, areas near roadways, coastal flood-prone areas, and urban areas that are subject to the heat island effect.<sup>3543</sup>

<sup>3543</sup> The heat island effect refers to developed areas having higher temperatures than surrounding rural areas.

The following discussion addresses environmental justice implications related to air quality and to climate change and carbon emissions in the context of this final rulemaking. Emissions of air pollutants may be affected by this rulemaking due to changes in fuel use and VMT, which are described above. To the degree to which minority and low-income populations may be present in proximity to the locations described in this section, they may be exposed disproportionately to these emissions changes. In addition, the following analysis also discusses other potential reasons why minority and low-income populations may be susceptible to the health impacts of air pollutants. NHTSA also discusses environmental justice in Chapter 7.5 of its FEIS.

a) *Proximity to Oil Production and Refining*

As stated above, numerous studies have found that some environmental hazards are more prevalent in areas where minority and low-income populations represent a higher proportion of the population compared with the general population. For example, one study found that survey respondents who were black and, to a lesser degree, had lower income levels, were significantly more likely to live within 1 mile of an industrial facility listed in the EPA's 1987 Toxic Release Inventory (TRI) national database.<sup>3544</sup>

A meta-analysis of 49 environmental equity studies concluded that evidence of race-based environmental inequities is statistically significant (although the average magnitude of

Mero. *Racial and Socioeconomic Disparities in Residential Proximity to Polluting Industrial Facilities: Evidence from the Americans' Changing Lives Study*. American Journal of Public Health 99(S3): S649–S656 (2009). doi:10.2105/AJPH.2007.131383. Available at: <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2774179/pdf/S649.pdf>. (Accessed: March 2, 2018).

these inequities is small), while evidence supporting the existence of income-based environmental inequities is substantially weaker.<sup>3545</sup> Considering poverty-based class effects, that meta-analysis found an inverse relationship between environmental risk and poverty, concluding that environmental risks are less likely to be located in areas of extreme poverty.<sup>3546</sup> However, individual studies may reach contradictory conclusions in relation to race- and income-based inequities across a range of environmental risks. Therefore, the meta-analysis also sought to examine the reasons why conclusions vary across studies of environmental inequity. Possible explanations for why studies reach contrary conclusions include variability in the source of potential environmental risk that the study considers (e.g., the type of facility or the associated level of pollution or risk); variability in the methodology applied to aggregate demographic data and to define the comparison population; and the degree to which statistical models control for other variables that may explain the distribution of potential environmental risk.

To test whether there are disparate impacts from hazardous industrial facilities on racial/ethnic minorities, the disadvantaged, the working class, and manufacturing workers, one study tested the relationship between hazard scores of Philadelphia-area facilities in EPA's Risk-Screening Environmental Indicators (RSEI) database and the demographics of populations near those facilities using multivariate regression.<sup>3547</sup> This study concluded that racial/ethnic

minorities, the most socioeconomically disadvantaged, and those employed in manufacturing suffer a disparate impact from the highest-hazard facilities (primarily manufacturing plants).

Other commissioned reports and case studies provide additional evidence of the presence of low-income and minority populations near industrial facilities and of racial or socioeconomic disparities in exposure to environmental risk, although these sources were not published in peer-reviewed scientific journals.<sup>3548, 3549, 3550, 3551</sup>

Few studies address disproportionate exposure to environmental risk associated with oil refineries specifically. One study found that the populations surrounding oil refineries are more often minorities, concluding that “56 percent of people living within three miles of [oil] refineries in the United States are minorities – almost double the national average.”<sup>3552</sup> Another examined whether findings of environmental inequity varied between coke production plants and oil refineries, both of which are significant sources of air pollution.<sup>3553</sup> This study concluded that

census tracts near coke plants had a disproportionate share of poor and nonwhite residents, and that existing inequities were primarily economic in nature. However, the findings for oil refineries did not strongly support an environmental inequity hypothesis. A more recent study of environmental justice in the oil refinery industry found evidence of environmental injustice as a result of unemployment levels in areas around refineries and, to a slightly lesser extent, as a result of income inequality.<sup>3554</sup> This study did not test for race-based environmental inequities.

Overall, the body of scientific literature points to disproportionate representation of minority and low-income populations in proximity to a range of industrial, manufacturing, and hazardous waste facilities that are stationary sources of air pollution; although results of individual studies may vary. While the scientific literature specific to oil refineries is limited, disproportionate exposure of minority and low-income populations to air pollution from oil refineries is suggested by other broader studies of racial and socioeconomic disparities in proximity to industrial facilities generally.

The potential increase in fuel production and consumption projected as a result of this rulemaking (compared to the No Action Alternative) could lead to an increase in upstream emissions of criteria and toxic air pollutants due to increased extraction, refining, and transportation of fuel. As described in Section VII.A.4.c.3.b.i, total upstream emissions of criteria and toxic air pollutants in 2035 are projected to increase under all action alternatives compared to the No Action Alternative, with the exception that total upstream emissions of SO<sub>2</sub>

<sup>3554</sup> Carpenter, A. and M. Wagner. *Environmental Justice in the Oil Refinery Industry: A Panel Analysis Across United States Counties*. *Ecological Economics* 159:101-109 (2019).

are projected to decrease under all action alternatives under the CAFE program (but not under the CO<sub>2</sub> program). As noted, a correlation between proximity to oil refineries and the prevalence of minority and low-income populations is suggested in the scientific literature. To the extent that minority and low-income populations live closer to oil refining facilities, these populations may be more likely to be adversely affected by these emissions. However, the magnitude of the change in emissions relative to the baseline is minor and would not be characterized as high and adverse.

b) *Proximity to High-Traffic Roadways*

Studies have more consistently demonstrated a disproportionate prevalence of minority and low-income populations living near mobile sources of pollutants. In certain locations in the United States, for example, there is consistent evidence that populations or schools near roadways typically include a greater percentage of minority or low-income residents.<sup>3555, 3556, 3557,</sup>

70,000 housing units across the nation. The study survey is conducted every two years by the U.S. Census Bureau. The second database the agencies analyzed was the U.S. Department of Education's Common Core of Data, which includes enrollment and location information for schools across the U.S.

In analyzing the 2009 AHS, the focus was on whether or not a housing unit was located within 300 feet of a "4-or-more lane highway, railroad, or airport."<sup>3575</sup> Whether there were differences between households in such locations compared with those in locations farther from these transportation facilities was analyzed.<sup>3576</sup> Other variables, such as land use category, region of country, and housing type, were included. Homes with a nonwhite householder were found to be 22 to 34 percent more likely to be located within 300 feet of these large transportation facilities than homes with white householders. Homes with a Hispanic householder were 17 to 33 percent more likely to be located within 300 feet of these large transportation facilities than homes with non-Hispanic householders. Households near large transportation facilities were, on average, lower in income and educational attainment, more likely to be a rental property, and more likely to be located in an urban area compared with households more distant from transportation facilities.

In examining schools near major roadways, the Common Core of Data (CCD) from the U.S. Department of Education, which includes information on all public elementary and

---

<sup>3575</sup> This variable primarily represents roadway proximity. According to the Central Intelligence Agency's World Factbook, in 2010, the United States had 6,506,204 km of roadways, 224,792 km of railways, and 15,079 airports. Highways thus represent the overwhelming majority of transportation facilities described by this factor in the AHS.

<sup>3576</sup> Bailey, C. (2011) Demographic and Social Patterns in Housing Units Near Large Highways and other Transportation Sources. Memorandum to docket.

secondary schools and school districts nationwide, was examined.<sup>3577</sup> To determine school proximities to major roadways, a geographic information system (GIS) to map each school and roadways based on the U.S. Census's TIGER roadway file was used.<sup>3578</sup> Minority students were found to be overrepresented at schools within 200 meters of the largest roadways, and schools within 200 meters of the largest roadways also had higher than expected numbers of students eligible for free or reduced-price lunches. For example, Black students represent 22 percent of students at schools located within 200 meters of a primary road, whereas Black students represent 17 percent of students in all U.S. schools. Hispanic students represent 30 percent of students at schools located within 200 meters of a primary road, whereas Hispanic students represent 22 percent of students in all U.S. schools.

Overall, there is substantial evidence that the population who lives or attends school near major roadways are more likely to be minority or low income. As described in Section VII.A.4.c.3.b.i, total downstream (tailpipe) emissions of criteria and toxic air pollutants for cars and light trucks in 2035 are projected to remain relatively unchanged or decrease under all action alternatives compared to the No Action Alternative, with the following exceptions: total downstream emissions of SO<sub>2</sub> would increase under all action alternatives under both the CAFE and CO<sub>2</sub> programs; total downstream emissions of acrolein would increase under Alternatives 5, 6, and 7 under the CAFE program (but not under the CO<sub>2</sub> program); and total downstream emissions of acetaldehyde and butadiene would increase under Alternatives 6 and 7 under the CAFE program (but not under the CO<sub>2</sub> program). To the extent minority and low-income

---

<sup>3577</sup> <http://nces.ed.gov/ccd/>.

<sup>3578</sup> Pedde, M.; Bailey, C. Identification of Schools within 200 Meters of U.S. Primary and Secondary Roads. Memorandum to the docket (2011).

populations disproportionately live or attend schools near major roadways, these populations may be more likely to be affected by these emissions. However, because some pollutant emissions are expected to decrease and others are expected to increase, health impacts are mixed. Overall, as the magnitude of the emissions changes is anticipated to be minor compared to total tailpipe emissions for these vehicles, the impacts to minority or low-income populations are not considered high and adverse.

The agencies used the standards that were discussed in the 2012 rulemaking as the baseline for this rulemaking. Therefore, the agencies project increases in certain air pollutants for purposes of this analysis. However, as discussed above, one impact of the standards finalized in this rulemaking is to reduce the up-front cost of new and used vehicles. Low income populations may benefit most from the reduction in cost of acquiring newer vehicles, which generally are more fuel efficient and have lower air pollutant emissions than older vehicles. This cost reduction may have the effect of encouraging the quicker adoption of cleaner vehicles in low income communities, which could result in air quality and health benefits for those who live or attend school in proximity to the roadways where they are operated. To the degree to which minority populations may also live in proximity to these roadways, they would also experience benefits, thereby mitigating the disparity in racial, ethnic, and economically based exposures.

*c) Other Vulnerabilities to Climate Change and Health Impacts of Air Pollutants*

Some areas most vulnerable to climate change tend to have a higher concentration of minority and low-income populations, potentially putting these communities at higher risk from

climate variability and climate-related extreme weather events.<sup>3579</sup> For example, urban areas tend to have pronounced social inequities that could result in disproportionately larger minority and low-income populations than those in the surrounding nonurban areas.<sup>3580</sup> Urban areas are also subject to the most substantial temperature increases from climate change because of the urban heat island effect.<sup>3581, 3582, 3583</sup> Taken together, these tendencies demonstrate a potential for disproportionate impacts on minority and low-income populations in urban areas. Low-income populations in coastal urban areas, which are vulnerable to increases in flooding as a result of projected sea-level rise, larger storm surges, and human settlement in floodplains, could also be disproportionately affected by climate change because they are less likely to have the means to evacuate quickly in the event of a natural disaster and, therefore, are at greater risk of injury and loss of life.<sup>3584, 3585</sup>

Independent of their proximity to pollution sources or climate change, locations of potentially high impact, minority and low-income populations could be more vulnerable to the health impacts of pollutants and climate change. Reports from the U.S. Department of Health

<sup>3585</sup> GCRP (2014).

and Human Services have stated that minority and low-income populations tend to have less access to health care services, and the services received are more likely to suffer with respect to quality.<sup>3586, 3587, 3588</sup> Other studies show that low socioeconomic position can modify the health effects of air pollution, with higher effects observed in groups with lower socioeconomic position.<sup>3589, 3590</sup> Possible explanations for this observation include that low socioeconomic position groups may be differentially exposed to air pollution or may be differentially vulnerable to effects of exposure.<sup>3591</sup>

In terms of climate change, increases in heat-related morbidity and mortality because of higher overall and extreme temperatures are likely to affect minority and low-income populations disproportionately, partially because of limited access to air conditioning and high

<sup>3591</sup> O'Neill et al. (2003).

energy costs.<sup>3592, 3593, 3594, 3595</sup> Native American tribes and Alaskan Native villages are also more susceptible to the impacts of climate change, as these groups often disproportionately rely on natural resources for livelihoods, medicines, and cultural and spiritual purposes.<sup>3596</sup> Moreover, coastal tribal communities may have to relocate because of sea-level rise, erosion, and permafrost thaw.<sup>3597</sup> NHTSA's FEIS provides additional discussion of health and societal impacts of climate change on indigenous communities in Section 8.6.5.2, *Sectoral Impacts of Climate Change*, under *Human Health and Human Security*.

Together, this information indicates that the same set of potential environmental effects (e.g., air pollutants, heat increases, and sea-level rise) may disproportionately affect minority and low-income populations because of socioeconomic circumstances or histories of discrimination and inequity.

As described in Chapter 5 of NHTSA's FEIS, the action alternatives are projected to increase CO<sub>2</sub> emissions from passenger cars and light trucks by 4 to 10 percent by 2100

<sup>3597</sup> Maldonado, J., C. Shearer, R. Bronen, K. Peterson, and H. Lazrus. *The Impact of Climate Change on Tribal Communities in the US: Displacement, Relocation, and Human Rights*. *Climatic Change* 120(3):601–14 (2013).

compared to the No Action Alternative. Impacts of climate change could disproportionately affect minority and low-income populations in urban areas that are subject to the most substantial temperature increases from climate change. These impacts are largely because of the urban heat island effect. Additionally, minority and low-income populations that live in flood-prone coastal areas could be disproportionately affected. However, the contribution of the action alternatives to climate change impacts would be very minor rather than high and adverse. Compared to the annual U.S. CO<sub>2</sub> emissions of 7,193 MMTCO<sub>2</sub>e from all sources by the end of the century projected by the GCAM Reference scenario, the action alternatives are projected to increase annual U.S. CO<sub>2</sub> emissions by 0.4 to 1.2 percent in 2100. Compared to annual global CO<sub>2</sub> emissions, the action alternatives would represent an even smaller percentage increase and ultimately, by 2100, are projected to result in percentage increases in global mean surface temperature, atmospheric CO<sub>2</sub> concentrations, and sea level, and decreases in ocean pH, ranging from 0.09 percent to less than 0.01 percent. Any impacts of this rulemaking on low-income and minority communities would be attenuated by a lengthy causal chain; but if one could attempt to draw those links, the changes to climate values would be very small and incremental compared to the expected changes associated with the emissions trajectories in the GCAM Reference scenario.

As reported in Section VII.A.4.c.3.c above, adverse health impacts over the lifetimes of vehicles through MY 2029 are projected to increase nationwide under each of the action alternatives (except Alternative 6 and Alternative 7 under the CAFE program, which show decreases) compared to the No Action Alternative. Increases in these pollutant emissions, however, would be primarily the result of increases in upstream emissions (emissions near refineries, power plants, and extraction sites), while downstream emissions (tailpipe emissions

near roadways) are anticipated to decrease or increase by smaller amounts. The health impacts reported in that section occur over a long period of time, would be incremental in magnitude, and would not be characterized as high. Those impacts would also be borne nationwide, so impacts to minority and low-income populations would be smaller.

*d) Conclusion*

Based on the foregoing, the agencies have determined that this rulemaking (and alternatives considered) would not result in disproportionately high and adverse human health or environmental effects on minority or low-income populations. This rulemaking would set standards nationwide, and although minority and low-income populations may experience some disproportionate effects, in particular locations, the overall impacts on human health and the environment would not be “high and adverse” under EO 12898.

Furthermore, the agencies note that there are no mitigation measures or alternatives available as part of this action that could fulfill the respective statutory missions of the agencies and that would address the considerations discussed in Section VIII (e.g., economic practicability) or avoid or reduce any disproportionate effects in particular locations experienced by minority and low-income populations. The impacts described in this analysis would result from air pollutant and CO<sub>2</sub> emissions that may occur from the levels of stringency selected by the agencies. However, for the reasons described in Section VIII, the agencies cannot select a higher level of stringency. While the agencies have considered the potential impacts described in this analysis, there is a substantial need, based on the overall public interest, to address the costs associated with the standards discussed in the 2012 rulemaking. More stringent

alternatives would have severe adverse social and economic costs, as described in Section VIII, and necessitate the level of standards finalized in this rulemaking.

12. Executive Order 13045: “Protection of Children from Environmental Health Risks and Safety Risks”

This action is subject to EO 13045 (62 FR 19885, April 23, 1997) because it is an economically significant regulatory action as defined by EO 12866, and the agencies have reason to believe that the environmental health or safety risks related to this action may have a disproportionate effect on children. Specifically, children are more vulnerable to adverse health effects related to mobile source emissions, as well as to the potential long-term impacts of climate change. Pursuant to EO 13045, NHTSA and EPA must prepare an evaluation of the environmental health or safety effects of the planned regulation on children and an explanation of why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the agencies. Further, this analysis may be included as part of any other required analysis.

This preamble and NHTSA’s Final EIS discuss air quality, climate change, and their related environmental and health effects, noting where these would disproportionately affect children. The EPA Administrator has also discussed the impact of climate-related health effects on children in the Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act (74 FR 66496, December 15, 2009). In addition, this preamble explains why the agencies’ final standards are preferable to other alternatives considered. Together, this preamble and NHTSA’s Final EIS satisfy the agencies’ responsibilities under EO 13045.

## F. Regulatory Flexibility Act

Pursuant to the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*, as amended by the Small Business Regulatory Enforcement Fairness Act (SBREFA) of 1996), whenever an agency is required to publish a notice of proposed rulemaking or final rule, it must prepare and make available for public comment a regulatory flexibility analysis that describes the effect of the rule on small entities (*i.e.*, small businesses, small organizations, and small governmental jurisdictions). No regulatory flexibility analysis is required if the head of an agency certifies the rule will not have a significant economic impact on a substantial number of small entities. SBREFA amended the Regulatory Flexibility Act to require Federal agencies to provide a statement of the factual basis for certifying that a rule will not have a significant economic impact on a substantial number of small entities.

Two comments argued that the agencies should prepare a regulatory flexibility analysis and convene a small business review panel to assess the impacts in accordance with the Regulatory Flexibility Act, 5 U.S.C. 601 *et seq.*, as amended by SBREFA.<sup>3598</sup> The agencies considered these comments and the impacts of this rule under the Regulatory Flexibility Act and certify that this rule will not have a significant economic impact on a substantial number of small entities. The following is the agencies' statement providing the factual basis for this certification pursuant to 5 U.S.C. 605(b).

---

<sup>3598</sup> See National Coalition for Advanced Transportation (NCAT) Comment, Docket No. NHTSA-2018-0067-11969, at 64-65; Workhorse Group, Inc. Comment, Docket No. NHTSA-2018-0067-12215, at 1-2.

Small businesses are defined based on the North American Industry Classification System (NAICS) code.<sup>3599</sup> One of the criteria for determining size is the number of employees in the firm. For establishments primarily engaged in manufacturing or assembling automobiles, as well as light duty trucks, the firm must have less than 1,500 employees to be classified as a small business. This rule would affect motor vehicle manufacturers. As shown in Table X-1, the agencies have identified 15 small manufacturers of passenger cars, light trucks, and SUVs of electric, hybrid, and internal combustion engines.<sup>3600</sup> The agencies acknowledge that some newer manufacturers may not be listed. However, those new manufacturers tend to have transportation products that are not part of the light-duty vehicle fleet and have yet to start production of light-duty vehicles. Moreover, NHTSA does not believe that there are a “substantial number” of these newer companies.<sup>3601</sup>

---

<sup>3599</sup> Classified in NAICS under Subsector 336—Transportation Equipment Manufacturing for Automobile Manufacturing (336111), Light Truck (336112), and Heavy Duty Truck Manufacturing (336120). <https://www.sba.gov/document/support-table-size-standards>.

<sup>3600</sup> Two comments pointed out that Workhorse Group Inc. was not listed as a small domestic vehicle manufacturer in Table XII-1 of the proposal. *See* National Coalition for Advanced Transportation (NCAT) Comment, Docket No. NHTSA-2018-0067-11969, at 64-65; Workhorse Group, Inc. Comment, Docket No. NHTSA-2018-0067-12215, at 1-2. Workhorse Group has been added to the table here, but neither its addition nor the existence of a small number of other new small manufacturers does not alter the conclusion that this rule will not have a significant economic impact on a substantial number of small entities.

<sup>3601</sup> 5 U.S.C. 605(b).

**Table X-1 – Small Domestic Vehicle Manufacturers**

<b>Manufacturers</b>	<b>Founded</b>	<b>Employees<sup>3602</sup></b>	<b>Estimated Annual Production<sup>3603</sup></b>	<b>Sale Price per Unit</b>
Karma Automotive	2014	625	900	\$130,000
BXR Motors	2008	< 10	< 100	\$155,000 to \$185,000
Falcon Motorsports	2009	5	< 100	\$300,000 to \$400,000
Lucra Cars	2005	8	< 100	\$100,000
Lyons Motor Car	2012	< 10	< 100	\$1,400,000
Rezvani Motors	2014	6	< 100	\$95,000 to \$270,000
Rossion Automotive	2007	6	< 100	\$90,000
Saleen	1984	51	< 100	\$100,000
Shelby American	1962	61	< 100	\$60,000 to \$250,000
Panoz	1988	20	< 100	\$155,000 to \$175,000
Faraday Future	2014	790	0	\$200,000 to \$300,000
Lucid Motor Car	2007	269	0	\$60,000
Rivian Automotive	2009	208	0	N/A
SF Motors	2016	204	0	N/A
Workhorse Group	2007	125	0	\$52,000

NHTSA believes that the rulemaking would not have a significant economic impact on the small vehicle manufacturers because under 49 CFR part 525, passenger car manufacturers making less than 10,000 vehicles per year can petition NHTSA to have alternative standards set for those manufacturers. These manufacturers do not currently meet the 27.5 mpg standard and must already petition the agency for relief. If the standard is raised, it has no meaningful impact on these manufacturers—they still must go through the same process and petition for relief. Given there already is a mechanism for relieving burden on small businesses, which is the purpose of the Regulatory Flexibility Act, a regulatory flexibility analysis was not prepared.

---

<sup>3602</sup> Estimated number of employees as of 2018, source: LinkedIn.com.

<sup>3603</sup> Rough estimate of light duty vehicle production for model year 2017.

Two comments argued that small manufacturers of electric vehicles would face a significant economic impact because their ability to earn credits would be “substantially diminished.”<sup>3604</sup> The method for earning credits applies equally across manufacturers and does not place small entities at a significant competitive disadvantage. In any event, even if the rule had a “significant economic impact” on these small EV manufacturers, the amount of these companies is not “a substantial number.”<sup>3605</sup> For these reasons, their existence does not alter the agencies’ analysis of the applicability of the Regulatory Flexibility Act. EPA believes this rulemaking would not have a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act, as amended by the Small Business Regulatory Enforcement Fairness Act. EPA is exempting from the CO<sub>2</sub> standards any manufacturer, domestic or foreign, meeting SBA’s size definitions of small business as described in 13 CFR 121.201. EPA adopted the same type of exemption for small businesses in the 2017 and later rulemaking. EPA estimates that small entities comprise less than 0.1 percent of total annual vehicle sales and exempting them will have a negligible impact on the CO<sub>2</sub> emissions reductions from the standards. Because EPA is exempting small businesses from the CO<sub>2</sub> standards, the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Therefore, EPA has not conducted a Regulatory Flexibility Analysis or a SBREFA SBAR Panel for the rule.

EPA regulations allow small businesses voluntarily to waive their small business exemption and optionally to certify to the CO<sub>2</sub> standards. This option allows small entity

---

<sup>3604</sup> National Coalition for Advanced Transportation (NCAT) Comment, Docket No. NHTSA-2018-0067-11969, at 65; Workhorse Group, Inc. Comment, Docket No. NHTSA-2018-0067-12215, at 2.

<sup>3605</sup> 5 U.S.C. 605.

manufacturers to earn CO<sub>2</sub> credits under the CO<sub>2</sub> program, if their actual fleetwide CO<sub>2</sub> performance is better than their fleetwide CO<sub>2</sub> target standard. However, the exemption waiver is optional for small entities and thus the agency believes that manufacturers opt into the CO<sub>2</sub> program if it is economically advantageous for them to do so, for example in order to generate and sell CO<sub>2</sub> credits. Therefore, EPA believes this voluntary option does not affect EPA's determination that the standards will impose no significant adverse impact on small entities.

G. Executive Order 13132 (Federalism)

Executive Order 13132 requires Federal agencies to develop an accountable process to ensure “meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications.” The Order defines the term “[p]olicies that have federalism implications” to include regulations that have “substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.” Under the Order, agencies may not issue a regulation that has federalism implications, that imposes substantial direct compliance costs, unless the Federal government provides the funds necessary to pay the direct compliance costs incurred by State and local governments, or the agencies consult with State and local officials early in the process of developing the proposed regulation. The agencies complied with the Order's requirements.

NHTSA also addressed the federalism implications of its proposal in *The Safer Affordable Fuel-Efficient Vehicles Rule Part One: One National Program* final rulemaking.<sup>3606</sup>

H. Executive Order 12988 (Civil Justice Reform)

Pursuant to Executive Order 12988, “Civil Justice Reform,”<sup>3607</sup> NHTSA has considered whether this rulemaking would have any retroactive effect. This proposed rule does not have any retroactive effect.

I. Executive Order 13175 (Consultation and Coordination With Indian Tribal Governments)

This final rule does not have tribal implications, as specified in Executive Order 13175 (65 FR 67249, November 9, 2000). This rule will be implemented at the Federal level and impose compliance costs only on vehicle manufacturers. Thus, Executive Order 13175 does not apply to this rule. Some comments complained that the agencies have not consulted or coordinated with Native American communities and Indian Tribes in promulgating this rule.<sup>3608</sup> Executive Order 13175 requires consultation with Tribal officials when agencies are developing policies that have “substantial direct effects” on Tribes and Tribal interests.<sup>3609</sup> Even accepting

the comments' description of the effects of the rule, they have identified only indirect effects of the standards on Tribal interests.<sup>3610</sup>

## J. Unfunded Mandates Reform Act

Section 202 of the Unfunded Mandates Reform Act of 1995 (UMRA) requires Federal agencies to prepare a written assessment of the costs, benefits, and other effects of a proposed or final rule that includes a Federal mandate likely to result in the expenditure by State, local, or Tribal governments, in the aggregate, or by the private sector, of more than \$100 million in any one year (adjusted for inflation with base year of 1995). Adjusting this amount by the implicit gross domestic product price deflator for 2016 results in \$148 million ( $111.416/75.324 = 1.48$ ).<sup>3611</sup> Before promulgating a rule for which a written statement is needed, section 205 of UMRA generally requires NHTSA and EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objective of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows NHTSA and EPA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the agency publishes with the rule an explanation of why that alternative was not adopted.

This rule will not result in the expenditure by State, local, or Tribal governments, in the aggregate, of more than \$148 million annually, but it will result in the expenditure of that

---

<sup>3610</sup> See, e.g., National Tribal Air Association Comment, Docket No. NHTSA-2018-0067-11948, at 4.

<sup>3611</sup> Bureau of Economic Analysis, National Income and Product Accounts (NIPA), Table 1.1.9 Implicit Price Deflators for Gross Domestic Product. [https://bea.gov/iTable/index\\_nipa.cfm](https://bea.gov/iTable/index_nipa.cfm).

magnitude by vehicle manufacturers and/or their suppliers. In developing this rule, NHTSA and EPA considered a variety of alternative average fuel economy standards lower and higher than those previously proposed. The fuel economy standards for MYs 2021-2026 are the least costly, most cost-effective, and least burdensome alternative that achieve the objectives of the rule.

#### K. Regulation Identifier Number

The Department of Transportation assigns a regulation identifier number (RIN) to each regulatory action listed in the Unified Agenda of Federal Regulations. The Regulatory Information Service Center publishes the Unified Agenda in April and October of each year. The RIN contained in the heading at the beginning of this document may be used to find this action in the Unified Agenda.

#### L. National Technology Transfer and Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) requires NHTSA and EPA to evaluate and use existing voluntary consensus standards in its regulatory activities unless doing so would be inconsistent with applicable law (*e.g.*, the statutory provisions regarding NHTSA’s vehicle safety authority, or EPA’s testing authority) or otherwise impractical.<sup>3612</sup>

Voluntary consensus standards are technical standards developed or adopted by voluntary consensus standards bodies. Technical standards are defined by the NTTAA as “performance-based or design-specific technical specification and related management systems practices.”

---

<sup>3612</sup> 15 U.S.C. 272.

They pertain to “products and processes, such as size, strength, or technical performance of a product, process or material.”

Examples of organizations generally regarded as voluntary consensus standards bodies include the American Society for Testing and Materials (ASTM), the Society of Automotive Engineers (SAE), and the American National Standards Institute (ANSI). If the agencies do not use available and potentially applicable voluntary consensus standards, they are required by the Act to provide Congress, through OMB, an explanation of the reasons for not using such standards.

For CO<sub>2</sub> emissions, EPA will collect data over the same tests that are used for the MY 2012-2016 CO<sub>2</sub> standards and for the CAFE program. This unified data collection will minimize the amount of testing done by manufacturers because manufacturers are already required to run these tests. For A/C credits, EPA will use a consensus methodology developed by the Society of Automotive Engineers (SAE) and also a new A/C test. EPA knows of no consensus standard available for the A/C test.

There are currently no voluntary consensus standards that NHTSA administers relevant to today’s CAFE standards.

M. Department of Energy Review

In accordance with 49 U.S.C. 32902(j)(2), NHTSA submitted this rule to the Department of Energy for review.

N. Paperwork Reduction Act

The Paperwork Reduction Act (PRA) of 1995, Public Law 104-13,<sup>3613</sup> gives OMB authority to regulate matters regarding the collection, management, storage, and dissemination of certain information by and for the Federal government. It seeks to reduce the total amount of paperwork handled by the government and the public. NHTSA strives to reduce the public's information collection burden hours each fiscal year by streamlining external and internal processes.

To this end, NHTSA will continue to collect information to ensure compliance with its CAFE program. NHTSA will reinstate its previously-approved collection of information for Corporate Average Fuel Economy (CAFE) reports specified in 49 CFR part 537 (OMB control number 2127-0019), add the additional burden for reporting changes adopted in the October 15, 2012 final rule that recently came into effect (*see* 77 FR 62623), and account for the change in burden in this rule as well as for other CAFE reporting provisions required by Congress and NHTSA. NHTSA is also changing the name of this collection to represent more accurately the breadth of all CAFE regulatory reporting. Although NHTSA is adding additional burden hours to its CAFE report requirement in 49 CFR 537, the agency believes there will be a reduction in the overall paperwork burden due to the standardization of data and the streamlined process.

In compliance with the PRA, the information collection request (ICR) abstracted below was forwarded to OMB for review and comment. The ICR describes the nature of the

---

<sup>3613</sup> Codified at 44 U.S.C. 3501 *et seq.*

information collection and its expected burden.

*Title:* Corporate Average Fuel Economy.

*Type of Request:* Reinstatement and amendment of a previously approved collection.

*OMB Control Number:* 2127-0019.

*Form Numbers:* NHTSA Form 1474 (CAFE Projections Reporting Template) and NHTSA Form 1475 (CAFE Credit Template).

*Requested Expiration Date of Approval:* Three years from date of approval.

*Summary of the collection of information:* As part of this rulemaking, NHTSA is reinstating and modifying its previously-approved collection for CAFE-related collections of information. NHTSA and EPA have coordinated their compliance and reporting requirements in an effort not to impose duplicative burdens on regulated entities. This information collection contains three different components: burden related to NHTSA's CAFE reporting requirements; burden related to CAFE compliance, but not via reporting requirements; and information gathered by NHTSA to help inform CAFE analyses. All templates referenced in this section will be available in the rulemaking docket and the NHTSA public information center<sup>3614</sup>.

---

<sup>3614</sup> [https://one.nhtsa.gov/cafe\\_pic/CAFE\\_PIC\\_Home.htm](https://one.nhtsa.gov/cafe_pic/CAFE_PIC_Home.htm)

## 1. CAFE Compliance Reports

NHTSA is reinstating<sup>3615</sup> its collection related to the reporting requirements in 49 U.S.C. 32907, “Reports and tests of manufacturers.” In that section, manufacturers are statutorily required to submit CAFE compliance reports to the Secretary of Transportation.<sup>3616</sup> The reports must state if a manufacturer will comply with its applicable fuel economy standard(s), describe what actions the manufacturer intends to take to comply with the standard(s), and include other information as required by NHTSA. Manufacturers are required to submit two CAFE compliance reports—a pre-model year report (PMY) and a mid-model year (MMY) report—each year. In the event a manufacturer needs to correct previously-submitted information, a manufacturer may need to file additional reports.<sup>3617</sup>

To implement this statute, NHTSA issued 49 CFR part 537, “Automotive Fuel Economy Reports,” which adds additional definition to the terms of section 32907. The first report, the PMY report must be submitted to NHTSA before December 31 of the calendar year prior to the corresponding model year and contain manufacturers’ projected information for that upcoming model year. The second report, the MMY report must be submitted by July 31 of the given model year and contain updated information from manufacturers based on actual and projected information known midway through the model year. Finally, the last report, a supplementary

---

<sup>3615</sup> This collection expired on April 30, 2016.

<sup>3616</sup> 49 U.S.C. 32907 (delegated to the NHTSA Administrator at 49 CFR 1.95). Because of this delegation, for purposes of discussion, statutory references to the Secretary of Transportation in this section will be discussed in terms of NHTSA or the NHTSA Administrator.

<sup>3617</sup> Specifically, a manufacturer shall submit a report containing the information during the 30 days before the beginning of each model year, and during the 30 days beginning the 180<sup>th</sup> day of the model year. When a manufacturer decides that actions reported are not sufficient to ensure compliance with that standard, the manufacturer shall report additional actions it intends to take to comply with the standard and include a statement about whether those actions are sufficient to ensure compliance.

report, is required to be submitted anytime a manufacturer needs to correct information previously submitted to NHTSA.

Compliance reports must include information on passenger and non-passenger automobiles (trucks) describing the projected and actual fuel economy standards, fuel economy performance values, production sales volumes and information on vehicle design features (*e.g.*, engine displacement and transmission class) and other vehicle attribute characteristics (*e.g.*, track width, wheel base, and other light truck off-road features). Manufacturers submit confidential and non-confidential versions of these reports to NHTSA. Confidential reports differ by including estimated or actual production sales information, which is withheld from public disclosure to protect each manufacturer's competitive sales strategies. NHTSA uses the reports as the basis for vehicle auditing and testing, which helps manufacturers correct reporting errors prior to the end of the model year and facilitate acceptance of their final CAFE report by the Environmental Protection Agency (EPA). The reports also help the agency, as well as the manufacturers who prepare them, anticipate potential compliance issues as early as possible, and help manufacturers plan their compliance strategies.

Further, NHTSA is modifying this collection to account for additional information manufacturers are required to include in their reports. In the CAFE standards previously promulgated for MY 2017 and beyond,<sup>3618</sup> NHTSA allowed for manufacturers to gain additional fuel economy benefits by installing certain technologies on their vehicles beginning with MY

---

<sup>3618</sup> 77 FR 62623 (Oct. 15, 2012).

2017.<sup>3619</sup> These technologies include air-conditioning systems with increased efficiency, off-cycle technologies whose benefits are not adequately captured on the Federal Test Procedure and/or the Highway Fuel Economy Test,<sup>3620</sup> and hybrid electric technologies installed on full-size pickup trucks. Prior to MY 2017, manufacturers were unable to earn a fuel economy benefit for these technologies, so NHTSA's reporting requirements did not include an opportunity to report them. Now, manufacturers must provide information on these technologies in their CAFE reports. NHTSA requires manufacturers to provide detailed information on the model types using these technologies to gain fuel economy benefits. These details are necessary to facilitate NHTSA's technical analyses and to ensure the agency can perform random enforcement audits when necessary.

In addition to a list of all fuel consumption improvement technologies utilized in their fleet, 49 CFR 537 requires manufacturers to report the make, model type, compliance category, and production volume of each vehicle equipped with each technology and the associated fuel consumption improvement value (FCIV). NHTSA is adding the reporting and enforcement burden hours and cost for these new incentives to this collection. Manufacturers can also petition the EPA and NHTSA, in accordance with 40 CFR 86.1868-12 or 40 CFR 86.1869-12, to gain additional credits based upon the improved performance of any of the new incentivized technologies allowed starting in model year 2017. EPA approves these petitions in collaboration with NHTSA and any adjustments are taken into account for both programs. As a part the agencies' coordination, NHTSA provides EPA with an evaluation of each new technology to

---

<sup>3619</sup> These technologies were not included in the burden for part 537 at the time as the additional reporting requirements would not take effect until years later.

<sup>3620</sup> *E.g.*, engine idle stop-start systems, active transmission warmup systems, etc.

ensure its direct impact on fuel economy and an assessment on the suitability of each technology for use in increasing a manufacturer's fuel economy performance. Furthermore, at times, NHTSA may independently request additional information from a manufacturer to support its evaluations. This information along with any research conclusions shared with EPA and NHTSA in the petitions is required to be submitted in manufacturer's CAFE reports.

NHTSA is also changing the burden hours for its CAFE reporting requirements in 49 CFR part 537 by adjusting the total amount of time spent collecting the required reporting information through the use of a standardized reporting template to streamline the collection process. The standardized template will be used by manufacturers to collect all the required CAFE information under 49 CFR 537.7(b) and (c) and provides a format which ensures accuracy, completeness, and better alignment with the final data provided to EPA.

## 2. Other CAFE Compliance Collections

NHTSA is adopting a new standardized template for manufacturers buying CAFE credits and for manufacturers submitting credit transactions in accordance with 49 CFR part 536. In 49 CFR part 536.5(d), NHTSA is required to assess compliance with fuel economy standards each year, utilizing the certified and reported CAFE data provided by the EPA for enforcement of the CAFE program pursuant to 49 U.S.C. 32904(e). Credit values are calculated based on the CAFE data from the EPA. If a manufacturer's vehicles in a particular compliance category performs better than its required fuel economy standard, NHTSA adds credits to the manufacturer's account for that compliance category. If a manufacturer's vehicles in a particular compliance category perform worse than the required fuel economy standard, NHTSA will add a credit deficit to the manufacturer's account and will provide written notification to the manufacturer

concerning its failure to comply. The manufacturer will be required to confirm the shortfall and must either: submit a plan indicating how it will allocate existing credits or earn, transfer, and/or acquire credits or pay the equivalent civil penalty. The manufacturer must submit a plan or payment within 60 days of receiving notification from NHTSA.

Manufacturers should use the credit transaction template any time a credit transaction request is sent to NHTSA. For example, manufacturers that purchase credits and want to apply them to their credit accounts will use the credit transaction template. The template NHTSA is adopting is a simple spreadsheet that credit entities fill out. When completed, credit entities will have an organized list of credit transactions and will be able to click a button on the spreadsheet to generate a joint transaction letter for trading parties to sign and submit to NHTSA, along with the spreadsheet. Entities trading credits are also required to provide to NHTSA all the confidential information associated with the monetary and non-monetary price of credit trades. NHTSA believes these changes will significantly reduce the burden on manufacturers in managing their CAFE credit accounts and provide better oversight of the CAFE credit program for NHTSA.

Finally, NHTSA is accounting for the additional burden due to existing CAFE program elements. In 49 CFR part 525, small volume manufacturers submit petitions to NHTSA for exemption from an applicable average fuel economy standard and to request to comply with a less stringent alternative average fuel economy standard. In 49 CFR part 534, manufacturers are required to submit information to NHTSA when establishing a corporate controlled relationship with another manufacturer. A controlled relationship exists between manufacturers that control, are controlled by, or are under common control with, one or more other manufacturers. Accordingly, manufacturers that have entered into written contracts transferring rights and

responsibilities to other manufacturers in controlled relationships for CAFE purposes are required to provide reports to NHTSA. There are additional reporting requirements for manufacturers submitting carry back plans and when manufacturers split apart from controlled relationships and must designate how credits are to be allocated between the parties.<sup>3621</sup> Manufacturers with credit deficits at the end of the model year, can carry back future earned credits up to three model years in advance of the deficit to resolve a current shortfall. The carryback plan proving the existence of a manufacturer's future earned credits must be submitted and approved by NHTSA, pursuant to 49 U.S.C. 32903(b).

### 3. Analysis Fleet Composition

As discussed in Section VI.B, in setting CAFE standards, NHTSA creates an analysis fleet from which to model potential future economy improvements. To compose this fleet, the agency uses a mixture of compliance data and information from other sources to replicate more closely the fleet from a recent model year. While refining the analysis fleet, NHTSA occasionally asks manufacturers for information that is similar to information submitted as part of EPA's final model year report (*e.g.*, final model year vehicle volumes). Periodically, NHTSA may ask manufacturers for more detailed information than what is required for compliance (*e.g.*, what engines are shared across vehicle models). Often, NHTSA requests this information from manufacturers after manufacturers have submitted their final model year reports to EPA, but before EPA processes and releases final model year reports.

---

<sup>3621</sup> See 49 CFR part 536.

Information like this, which is used to verify and supplement the data used to create the analysis fleet, is tremendously valuable to generating an accurate analysis fleet, and setting maximum feasible standards. The more accurate the analysis fleet is, the more accurate the modeling of what technologies could be applied will be. Therefore, NHTSA is accounting for the burden on manufacturers to provide the agency with this additional information. In almost all instances, manufacturers already have the information NHTSA seeks, but it might need to be reformatted or recompiled. Because of this, NHTSA believes the burden to provide this information will often be minimal.

*Affected Public:* Respondents are manufacturers of engines and vehicles within the North American Industry Classification System (NAICS) and use the coding structure as defined by NAICS including codes 33611, 336111, 336112, 33631, 33631, 33632, 336320, 33635, and 336350 for motor vehicle and parts manufacturing.

*Respondent's obligation to respond:* Regulated entities are required to respond to inquiries covered by this collection. 49 U.S.C. 32907. 49 CFR part 525, 534, 536, and 537.

*Frequency of response:* Variable, based on compliance obligation. Please see PRA supporting documentation in the docket for more detailed information.

*Average burden time per response:* Variable, based on compliance obligation. Please see PRA supporting documentation in the docket for more detailed information.

*Number of respondents:* 23.

4. Estimated Total Annual Burden Hours and Costs:

**Table X-2 – Estimated Burden for Reporting Requirements**

<b>Applies to:</b>	<b>Manufacturer</b>		<b>Government</b>	
	<b>Hours</b>	<b>Cost</b>	<b>Hours</b>	<b>Cost</b>
Prior Collection	3,189.00	\$24,573.50	975.00	\$31,529.00
Current Collection	4,018.73	\$198,885.02	3,038.00	\$141,246.78
Difference	829.73	\$174,311.52	2,063.00	\$109,717.78

O. Privacy Act

In accordance with 5 U.S.C. 553(c), the agencies solicited comments from the public to inform the rulemaking process better. These comments are posted, without edit, to [www.regulations.gov](http://www.regulations.gov), as described in DOT’s system of records notice, DOT/ALL-14 FDMS, accessible through [www.transportation.gov/privacy](http://www.transportation.gov/privacy). In order to facilitate comment tracking and response, the agencies encouraged commenters to provide their names, or the names of their organizations; however, submission of names is completely optional.

**Regulatory Text**

For the reasons discussed in the preamble, the National Highway Traffic Safety Administration amends 49 CFR chapter V as follows:

**List of Subjects**

**49 CFR Part 523, 531, and 533**

Fuel economy.

**49 CFR Part 536 and 537**

Fuel economy, Reporting and recordkeeping requirements.

**PART 523 – VEHICLE CLASSIFICATION**

- 1. The authority citation for part 523 continues to read as follows:

Authority: 49 U.S.C 32901; delegation of authority at 49 CFR 1.95.

- 2. Amend § 523.2 by revising the definitions of “Curb weight” and “Full-size pickup truck” to read as follows:

**§ 523.2 Definitions.**

\* \* \* \* \*

*Curb weight* has the meaning given in 40 CFR 86.1803-01.

\* \* \* \* \*

*Full-size pickup truck* means a light truck or medium duty passenger vehicle that meets the specifications in 40 CFR 86.1803-01.

\* \* \* \* \*

**PART 531 – PASSENGER AUTOMOBILE AVERAGE FUEL ECONOMY STANDARDS**

3. The authority citation for part 531 is revised to read as follows:

Authority: 49 U.S.C. 32902; delegation of authority at 49 CFR 1.95.

4. Amend § 531.5 by revising the introductory text of paragraph (c), Table III to paragraph (c), and paragraph (d), removing paragraph (e), and redesignating paragraph (f) as paragraph (e) to read as follows:

**§ 531.5 Fuel economy standards.**

\* \* \* \* \*

(c) For model years 2012-2026, a manufacturer’s passenger automobile fleet shall comply with the fleet average fuel economy level calculated for that model year according to Figure 2 and the appropriate values in Table III.

\* \* \*

TABLE III – PARAMETERS FOR THE PASSENGER AUTOMOBILE FUEL ECONOMY TARGETS, MYS  
2012-2026

Model year	Parameters			
	<i>a</i> (mpg)	<i>b</i> (mpg)	<i>c</i> (gal/mi/ft <sup>2</sup> )	<i>d</i> (gal/mi)
2012.....	35.95	27.95	0.0005308	0.006057
2013.....	36.80	28.46	0.0005308	0.005410
2014.....	37.75	29.03	0.0005308	0.004725
2015.....	39.24	29.90	0.0005308	0.003719
2016.....	41.09	30.96	0.0005308	0.002573

Model year	Parameters			
	<i>a</i> (mpg)	<i>b</i> (mpg)	<i>c</i> (gal/mi/ft <sup>2</sup> )	<i>d</i> (gal/mi)
2017.....	43.61	32.65	0.0005131	0.001896
2018.....	45.21	33.84	0.0004954	0.001811
2019.....	46.87	35.07	0.0004783	0.001729
2020.....	48.74	36.47	0.0004603	0.001643
2021.....	49.48	37.02	0.000453	0.00162
2022.....	50.24	37.59	0.000447	0.00159
2023.....	51.00	38.16	0.000440	0.00157
2024.....	51.78	38.74	0.000433	0.00155
2025.....	52.57	39.33	0.000427	0.00152
2026.....	53.37	39.93	0.000420	0.00150

(d) In addition to the requirements of paragraphs (b) and (c) of this section, each manufacturer shall also meet the minimum fleet standard for domestically manufactured passenger automobiles expressed in Table IV:

TABLE IV – MINIMUM FUEL ECONOMY STANDARDS FOR DOMESTICALLY MANUFACTURED PASSENGER AUTOMOBILES, MYS 2011-2026

Model year	Minimum standard
2011.....	27.8
2012.....	30.7
2013.....	31.4
2014.....	32.1

2015.....	33.3
2016.....	34.7
2017.....	36.8
2018.....	38.1
2019.....	39.6
2020.....	41.1
2021.....	39.9
2022.....	40.6
2023.....	41.1
2024.....	41.8
2025.....	42.4
2026.....	43.1

(e) The following manufacturers shall comply with the standards indicated below for the specified model years:

\* \* \* \* \*

5. Amend § 531.6 by revising paragraphs (a) and (b) to read as follows:

**§ 531.6 Measurement and calculation procedures.**

(a) The fleet average fuel economy performance of all passenger automobiles that are manufactured by a manufacturer in a model year shall be determined in accordance with procedures established by the Administrator of the Environmental Protection Agency under 49 U.S.C. 32904 and set forth in 40 CFR part 600. For model years 2017 to 2026, a manufacturer is eligible to increase the fuel economy performance of passenger cars in accordance with

procedures established by the EPA set forth in 40 CFR 600, Subpart F, including any adjustments to fuel economy the EPA allows, such as for fuel consumption improvements related to air conditioning efficiency and off-cycle technologies.

(1) A manufacturer that seeks to increase its fleet average fuel economy performance through the use of technologies that improve the efficiency of air conditioning systems must follow the requirements in 40 CFR 86.1868-12. Fuel consumption improvement values resulting from the use of those air conditioning systems must be determined in accordance with 40 CFR 600.510-12(c)(3)(i).

(2) A manufacturer that seeks to increase its fleet average fuel economy performance through the use of off-cycle technologies must follow the requirements in 40 CFR 86.1869-12. A manufacturer is eligible to gain fuel consumption improvements for predefined off-cycle technologies in accordance with 40 CFR 86.1869-12(b) or for technologies tested using the EPA's 5-cycle methodology in accordance with 40 CFR 86.1869-12(c). The fuel consumption improvement is determined in accordance with 40 CFR 600.510-12(c)(3)(ii).

(b) A manufacturer is eligible to increase its fuel economy performance through use of an off-cycle technology requiring an application request made to the EPA in accordance with 40 CFR 86.1869-12(d). The request must be approved by the EPA in consultation with NHTSA. To expedite NHTSA's consultation with the EPA, a manufacturer shall concurrently submit its application to NHTSA if the manufacturer is seeking off-cycle fuel economy improvement values under the CAFE program for those technologies. For off-cycle technologies that are covered under 40 CFR 86.1869-12(d), NHTSA will consult with the EPA regarding NHTSA's evaluation of the specific off-cycle technology to ensure its impact on fuel economy and the suitability of using the off-cycle technology to adjust the fuel economy performance. NHTSA

will provide its views on the suitability of the technology for that purpose to the EPA. NHTSA's evaluation and review will consider:

(1) Whether the technology has a direct impact upon improving fuel economy performance;

(2) Whether the technology is related to crash-avoidance technologies, safety critical systems or systems affecting safety-critical functions, or technologies designed for the purpose of reducing the frequency of vehicle crashes;

(3) Information from any assessments conducted by the EPA related to the application, the technology and/or related technologies; and

(4) Any other relevant factors.

**PART 533 – LIGHT TRUCK FUEL ECONOMY STANDARDS**

6. The authority citation for part 533 is revised to read as follows:

Authority: 49 U.S.C. 32902; delegation of authority at 49 CFR 1.95.

7. Amend § 533.5 by revising Table VII to paragraph (a) to read as follows and removing paragraph (k).

**§ 533.5 Requirements.**

(a) \* \* \* \* \*

\* \* \*

TABLE VII – PARAMETERS FOR THE LIGHT TRUCK FUEL ECONOMY TARGETS FOR MYS 2017-2026

Model year	Parameters							
	<i>a</i> (mpg)	<i>b</i> (mpg)	<i>c</i> (gal/mi/ft <sup>2</sup> )	<i>D</i> (gal/mi)	<i>e</i> (mpg)	<i>f</i> (mpg)	<i>g</i> (gal/mi/ft <sup>2</sup> )	<i>h</i> (gal/mi)
2017	36.26	25.09	0.0005484	0.005097	35.10	25.09	0.0004546	0.009851
2018	37.36	25.20	0.0005358	0.004797	35.31	25.20	0.0004546	0.009682
2019	38.16	25.25	0.0005265	0.004623	35.41	25.25	0.0004546	0.009603
2020	39.11	25.25	0.0005140	0.004494	35.41	25.25	0.0004546	0.009603
2021	39.71	25.63	0.000506	0.00443	NA	NA	NA	NA
2022	40.31	26.02	0.000499	0.00436	NA	NA	NA	NA
2023	40.93	26.42	0.000491	0.00429	NA	NA	NA	NA
2024	41.55	26.82	0.000484	0.00423	NA	NA	NA	NA
2025	42.18	27.23	0.000477	0.00417	NA	NA	NA	NA
2026	42.82	27.64	0.000469	0.00410	NA	NA	NA	NA

8. Amend § 533.6 by revising paragraphs (b) and (c) to read as follows:

**§ 533.6 Measurement and calculation procedures.**

\* \* \* \* \*

(b) The fleet average fuel economy performance of all light trucks that are manufactured by a manufacturer in a model year shall be determined in accordance with procedures established by the Administrator of the Environmental Protection Agency under 49 U.S.C. 32904 and set forth in 40 CFR part 600. For model years 2017 to 2026, a manufacturer is eligible to increase the fuel economy performance of light trucks in accordance with procedures established by the EPA set forth in 40 CFR part 600, Subpart F, including any adjustments to fuel economy the

EPA allows, such as for fuel consumption improvements related to air conditioning efficiency, off-cycle technologies, and hybridization and other performance-based technologies for full-size pickup trucks that meet the requirements specified in 40 CFR 86.1803.

(1) A manufacturer that seeks to increase its fleet average fuel economy performance through the use of technologies that improve the efficiency of air conditioning systems must follow the requirements in 40 CFR 86.1868-12. Fuel consumption improvement values resulting from the use of those air conditioning systems must be determined in accordance with 40 CFR 600.510-12(c)(3)(i).

(2) A manufacturer that seeks to increase its fleet average fuel economy performance through the use of off-cycle technologies must follow the requirements in 40 CFR 86.1869-12. A manufacturer is eligible to gain fuel consumption improvements for predefined off-cycle technologies in accordance with 40 CFR 86.1869-12(b) or for technologies tested using the EPA's 5-cycle methodology in accordance with 40 CFR 86.1869-12(c). The fuel consumption improvement is determined in accordance with 40 CFR 600.510-12(c)(3)(ii).

(3) The eligibility of a manufacturer to increase its fuel economy using hybridized and other performance-based technologies for full-size pickup trucks must follow 40 CFR 86.1870-12 and the fuel consumption improvement of these full-size pickup truck technologies must be determined in accordance with 40 CFR 600.510-12(c)(3)(iii).

(c) A manufacturer is eligible to increase its fuel economy performance through use of an off-cycle technology requiring an application request made to the EPA in accordance with 40 CFR 86.1869-12(d). The request must be approved by the EPA in consultation with NHTSA. To expedite NHTSA's consultation with the EPA, a manufacturer shall concurrently submit its application to NHTSA if the manufacturer is seeking off-cycle fuel economy improvement

values under the CAFE program for those technologies. For off-cycle technologies that are covered under 40 CFR 86.1869-12(d), NHTSA will consult with the EPA regarding NHTSA's evaluation of the specific off-cycle technology to ensure its impact on fuel economy and the suitability of using the off-cycle technology to adjust the fuel economy performance. NHTSA will provide its views on the suitability of the technology for that purpose to the EPA. NHTSA's evaluation and review will consider:

(1) Whether the technology has a direct impact upon improving fuel economy performance;

(2) Whether the technology is related to crash-avoidance technologies, safety critical systems or systems affecting safety-critical functions, or technologies designed for the purpose of reducing the frequency of vehicle crashes;

(3) Information from any assessments conducted by the EPA related to the application, the technology and/or related technologies; and

(4) Any other relevant factors.

## **PART 535 – MEDIUM- AND HEAVY-DUTY VEHICLE FUEL EFFICIENCY PROGRAM**

9. The authority citation for part 535 continues to read as follows:

Authority: 49 U.S.C. 32902 and 30101; delegation of authority at 49 CFR 1.95.

10. Amend § 535.6 by revising paragraphs (a)(4)(ii) and (d)(5)(ii) to read as follows:

### **§ 535.6 Measurement and calculation procedures.**

\* \* \* \* \*

(a) \* \* \*

(4) \* \* \*

(ii) Calculate the equivalent fuel consumption test group results as follows for spark-ignition vehicles and alternative fuel spark-ignition vehicles. CO<sub>2</sub> emissions test group result (grams per mile)/((8,887 grams per gallon of gasoline fuel) × (10<sup>-2</sup>)) = Fuel consumption test group result (gallons per 100 mile).

\* \* \* \* \*

(d) \* \* \*

(5) \* \* \*

(ii) Calculate equivalent fuel consumption FCL values for spark-ignition engines and alternative fuel spark-ignition engines. CO<sub>2</sub> FCL value (grams per hp-hr)/((8,887 grams per gallon of gasoline fuel) × (10<sup>-2</sup>)) = Fuel consumption FCL value (gallons per 100 hp-hr).

\* \* \* \* \*

12. Amend § 535.7 by revising the equations in paragraphs (b)(1), (c)(1), (d)(1), (e)(2), and (f)(2)(iii)(E) to read as follows:

**§ 535.7 Averaging, banking, and trading (ABT) credit program.**

\* \* \* \* \*

(b) \* \* \*

(1) \* \* \*

$$\text{Total MY Fleet FCC (gallons)} = (\text{Std} - \text{Act}) \times (\text{Volume}) \times (\text{UL}) \times (10^{-2})$$

Where:

Std = Fleet average fuel consumption standard (gal/100 mile).

Act = Fleet average actual fuel consumption value (gal/100 mile).

Volume = the total U.S.-directed production of vehicles in the regulatory subcategory.

UL = the useful life for the regulatory subcategory. The useful life value for heavy-pickup trucks and vans manufactured for model years 2013 through 2020 is equal to the 120,000 miles. The useful life for model years 2021 and later is equal to 150,000 miles.

\* \* \* \* \*

(c) \* \* \*

(1) \* \* \*

$$\text{Vehicle Family FCC (gallons)} = (\text{Std} - \text{FEL}) \times (\text{Payload}) \times (\text{Volume}) \times (\text{UL}) \times (10^{-3})$$

Where:

Std = the standard for the respective vehicle family regulatory subcategory (gal/1000 ton-mile).

FEL = family emissions limit for the vehicle family (gal/1000 ton-mile).

Payload = the prescribed payload in tons for each regulatory subcategory as shown in the following table:

Regulatory subcategory	Payload (Tons)
Vocational LHD Vehicles	2.85
Vocational MHD Vehicles	5.60
Vocational HHD Vehicles	7.5
MDH Tractors	12.50
HHD Tractors, other than heavy-haul Tractors	19.00
Heavy-haul Tractors	43.00

Volume = the number of U.S.-directed production volume of vehicles in the corresponding vehicle family.

UL = the useful life for the regulatory subcategory (miles) as shown in the following table:

Regulatory subcategory	UL (miles)
LHD Vehicles	110,000 (Phase 1) 150,000 (Phase 2)
Vocational MHD Vehicles and tractors at or below 33,000 pounds GVWR	185,000
Vocation HHD Vehicles and tractors at or above 33,000 pounds GVWR	435,000

\* \* \* \* \*

(d) \* \* \*

(1) \* \* \*

$$\text{Engine Family FCC (gallons)} = (\text{Std} - \text{FCL}) \times (\text{CF}) \times (\text{Volume}) \times (\text{UL}) \times (10^{-2})$$

Where:

Std = the standard for the respective engine regulatory subcategory (gal/100 hp-hr).

FCL = family certification level for the engine family (gal/100 hp-hr).

CF= a transient cycle conversion factor in hp-hr/mile which is the integrated total cycle horsepower-hour divided by the equivalent mileage of the applicable test cycle. For engines subject to spark-ignition heavy-duty standards, the equivalent mileage is 6.3 miles. For engines subject to compression-ignition heavy-duty standards, the equivalent mileage is 6.5 miles.

Volume = the number of engines in the corresponding engine family.

UL = the useful life of the given engine family (miles) as shown in the following table:

Regulatory Subcategory	UL (miles)
SI and CI LHD Engines	120,000 (Phase 1) 150,000 (Phase 2)
CI MHD Engines	185,000
CI HHD Engines	435,000

\* \* \* \* \*

(e) \* \* \*

(2) \* \* \*

$$\text{Vehicle Family FCC (gallons)} = (\text{Std} - \text{FEL}) \times (\text{Payload}) \times (\text{Volume}) \times (\text{UL}) \times (10^{-3})$$

Where:

Std = the standard for the respective vehicle family regulatory subcategory (gal/1000 ton-mile).

FEL = family emissions limit for the vehicle family (gal/1000 ton-mile).

Payload = 10 tons for short box vans and 19 tons for other trailers.

Volume = the number of U.S.-directed production volume of vehicles in the corresponding vehicle family.

UL = the useful life for the regulatory subcategory. The useful life value for heavy-duty trailers is equal to 250,000 miles.

\* \* \* \* \*

(f) \* \* \*

(2) \* \* \*

(iii) \* \* \*

(E) \* \* \*

$$\text{Off-cycle FC credits} = (\text{CO}_2 \text{ Credit/CF}) \times \text{Production} \times \text{VLM}$$

Where:

CO<sub>2</sub> Credits = the credit value in grams per mile determined in 40 CFR 86.1869-12(c)(3), (d)(1), (d)(2) or (d)(3).

CF = conversion factor, which for spark-ignition engines is 8,887 and for compression-ignition engines is 10,180.

Production = the total production volume for the applicable category of vehicles

VLM = vehicle lifetime miles, which for 2b-3 vehicles shall be 150,000 for the Phase 2 program.

The term (CO<sub>2</sub> Credit/CF) should be rounded to the nearest 0.0001

\* \* \* \* \*

### **PART 536 – TRANSFER AND TRADING OF FUEL ECONOMY CREDITS**

13. The authority citation for part 536 is revised to read as follows:

Authority: 49 U.S.C. 32903; delegation of authority at 49 CFR 1.95.

14. Amend § 536.4 by revising paragraph (c) to read as follows:

#### **§ 536.4 Credits.**

\* \* \* \* \*

(c) Adjustment factor. When traded or transferred and used, fuel economy credits are adjusted to ensure fuel oil savings is preserved. For traded credits, the user (or buyer) must multiply the calculated adjustment factor by the number of shortfall credits it plans to offset in

order to determine the number of equivalent credits to acquire from the earner (or seller). For transferred credits, the user of credits must multiply the calculated adjustment factor by the number of shortfall credits it plans to offset in order to determine the number of equivalent credits to transfer from the compliance category holding the available credits. The adjustment factor is calculated according to the following formula:

$$\underline{A} = \frac{VMT_u * MPG_{ae} * MPG_{se}}{VMT_e * MPG_{au} * MPG_{su}}$$

Where:

A = Adjustment factor applied to traded and transferred credits. The quotient shall be rounded to 4 decimal places;

\* \* \* \* \*

15. Amend § 536.5 by revising paragraph (c) and revising paragraph (d)(6) to read as follows:

**§ 536.5 Trading infrastructure.**

\* \* \* \* \*

(c) Automatic debits and credits of accounts.

(1) To carry credits forward, backward, transfer credits, or trade credits into other credit accounts, a manufacturer or credit holder must submit a credit instruction to NHTSA. A credit instruction must detail and include:

(i) The credit holder(s) involved in the transaction.

(ii) The originating credits described by the amount of the credits, compliance category and the vintage of the credits.

(iii) The recipient credit account(s) for banking or applying the originating credits described by the compliance category(ies), model year(s), and if applicable the adjusted credit amount(s) and adjustment factor(s).

(iv) For trades, a contract authorizing the trade signed by the manufacturers or credit holders or by managers legally authorized to obligate the sale and purchase of the traded credits.

(2) Upon receipt of a credit instruction from an existing credit holder, NHTSA verifies the presence of sufficient credits in the account(s) of the credit holder(s) involved as applicable and notifies the credit holder(s) that the credits will be debited from and/or credited to the accounts involved, as specified in the credit instruction. NHTSA determines if the credits can be debited or credited based upon the amount of available credits, accurate application of any adjustment factors and the credit requirements prescribed by this part that are applicable at the time the transaction is requested.

(3) After notifying the credit holder(s), all accounts involved are either credited or debited, as appropriate, in line with the credit instruction. Traded credits identified by a specific compliance category are deposited into the recipient's account in that same compliance category and model year. If a recipient of credits as identified in a credit instruction is not a current account holder, NHTSA establishes the credit recipient's account, subject to the conditions described in 49 CFR § 536.5(b), and adds the credits to the newly-opened account.

(4) NHTSA will automatically delete unused credits from holders' accounts when those credits reach their expiry date.

(5) Starting in model year 2021, manufacturers or credit holders issuing credit instructions or providing credit allocation plans as specified in 49 CFR § 536.5(d), must use the NHTSA Credit Template fillable form (OMB Control No. 2127-0019, NHTSA Form 1475).

The NHTSA Credit Template is available for download on NHTSA’s website. If a credit instruction includes a trade, the NHTSA Credit Template must be signed by managers legally authorized to obligate the sale and/or purchase of the traded credits from both parties to the trade. The NHTSA Credit Template signed by both parties to the trade serves as an acknowledgement that the parties have agreed to trade credits, and does not dictate terms, conditions, or other business obligations of the parties. All parties trading credits must also provide NHTSA the price paid for the credits including a description of any other monetary or non-monetary terms affecting the price of the traded credits, such as any technology exchanged or shared for the credits, any other non-monetary payment for the credits, or any other agreements related to the trade. Manufacturers must submit this information to NHTSA in a PDF document along with the Credit Template through the CAFE email, [cafe@dot.gov](mailto:cafe@dot.gov). NHTSA reserves the right to request additional information from the parties regarding the terms of the trade.

(6) NHTSA will consider claims that information submitted to the agency under this section is entitled to confidential treatment under 5 U.S.C. 552(b) and under the provisions of 49 CFR Part 512 if the information is submitted in accordance with the procedures of that part.

\* \* \* \* \*

(d) \* \* \* \* \*

(6) Credit allocation plans received from a manufacturer will be reviewed and approved by NHTSA. Starting in model year 2021, use the NHTSA Credit Template (OMB Control No. 2127–0019, NHTSA Form 1475) to record the credit transactions requested in the credit allocation plan. The template is a fillable form that has an option for recording and calculating credit transactions for credit allocation plans. The template calculates the required adjustments to the credits. The credit allocation plan and the completed transaction template must be

submitted to NHTSA. NHTSA will approve the credit allocation plan unless it finds that the proposed credits are unavailable or that it is unlikely that the plan will result in the manufacturer earning sufficient credits to offset the subject credit shortfall. If the plan is approved, NHTSA will revise the respective manufacturer's credit account accordingly. If the plan is rejected, NHTSA will notify the respective manufacturer and request a revised plan or payment of the appropriate fine.

### **PART 537 – AUTOMOTIVE FUEL ECONOMY REPORTS**

16. The authority citation for part 537 is revised to read as follows:

Authority: 49 U.S.C. 32907; delegation of authority at 49 CFR 1.95.

17. Amend § 537.5 by redesignating paragraph (d) as paragraph (e) and adding a new paragraph (d) to read as follows:

#### **§ 537.5 General requirements for reports.**

\* \* \* \* \*

(d) Beginning with model year 2023, each manufacturer shall generate reports required by this part using the NHTSA CAFE Projections Reporting Template (OMB Control No. 2127–0019, NHTSA Form 1474). The template is a fillable form.

(1) Select the option to identify the report as a pre-model year report, mid-model year report, or supplementary report as appropriate;

(2) Complete all required information for the manufacturer and for all vehicles produced for the current model year required to comply with CAFE standards. Identify the manufacturer submitting the report, including the full name, title, and address of the official responsible for preparing the report and a point of contact to answer questions concerning the report.

(3) Use the template to generate confidential and non-confidential reports for all the domestic and import passenger cars and light truck fleet produced by the manufacturer for the current model year. Manufacturers must submit a request for confidentiality in accordance with 49 CFR 512 to withhold projected production sales volume estimates from public disclosure. If the request is granted, NHTSA will withhold the projected production sales volume estimates from public disclosure until all the vehicles produced by the manufacturer have been made available for sale (usually one year after the current model year).

(4) Submit confidential reports and requests for confidentiality to NHTSA on CD-ROM in accordance with Part 537.12. Email copies of non-confidential (i.e., redacted) reports to NHTSA's secure email address: [cafe@dot.gov](mailto:cafe@dot.gov). Requests for confidentiality must be submitted in a PDF or MS Word format. Submit 2 copies of the CD-ROM to: Administrator, National Highway Traffic Administration, 1200 New Jersey Avenue SE, Washington, DC 20590, and submit emailed reports electronically to the following secure email address: [cafe@dot.gov](mailto:cafe@dot.gov);

(5) Confidentiality Requests.

(i) Manufacturers can withhold information on projected production sales volumes under 5 U.S.C. 552(b)(4) and 15 U.S.C. 2005(d)(1). In accordance, the manufacturer must:

- (A) Show that the item is within the scope of sections 552(b)(4) and 2005(d)(1);
- (B) Show that disclosure of the item would result in significant competitive damage;
- (C) Specify the period during which the item must be withheld to avoid that damage; and
- (D) Show that earlier disclosure would result in that damage.

(ii) [Reserved]

(e) Each report required by this part must be based upon all information and data available to the manufacturer 30 days before the report is submitted to the Administrator.

18. Amend § 537.6 by revising paragraphs (b) and (c) to read as follows:

**§ 537.6 General content of reports.**

\* \* \* \* \*

(b) Supplementary report. Except as provided in paragraph (c) of this section, each supplementary report for each model year must contain the information required by § 537.7(a)(1) and (a)(2), as appropriate for the vehicle fleets produced by the manufacturer, in accordance with § 537.8(b)(1), (2), (3), and (4) as appropriate.

(c) Exceptions. The pre-model year report, mid-model year report, and supplementary report(s) submitted by an incomplete automobile manufacturer for any model year are not required to contain the information specified in § 537.7 (c)(4) (xv) through (xviii) and (c)(5). The information provided by the incomplete automobile manufacturer under § 537.7(c) shall be according to base level instead of model type or carline.

19. Amend § 537.7 by revising paragraph (a) to read as follows:

**§ 537.7 Pre-model year and mid-model year reports.**

(a)(1) Provide a report with the information required by paragraphs (b) and (c) of this section for each domestic and import passenger automobile fleet, as specified in part 531 of this chapter, for the current model year.

(2) Provide a report with the information required by paragraphs (b) and (c) of this section for each light truck fleet, as specified in part 533 of this chapter, for the current model year.

(3) For model year 2023 and later, provide the information required by paragraphs (a)(1) and (2) for pre-model and mid-model year reports in accordance with the NHTSA CAFE Projections Reporting Template (OMB Control No. 2127–0019, NHTSA Form 1474). The required reporting template can be downloaded from NHTSA’s website.

\* \* \* \* \*

20. Amend § 537.7 by revising paragraphs (b)(3), (c)(1), (c)(3), (c)(7)(i), (c)(7)(ii), and (c)(7)(iii) to read as follows:

**§ 537.7 Pre-model year and mid-model year reports.**

\* \* \* \* \*

(b) \* \* \* \* \*

(3) State the projected required fuel economy for the manufacturer’s passenger automobiles and light trucks determined in accordance with 49 CFR 531.5(c) and 49 CFR 533.5 and based upon the projected sales figures provided under paragraph (c)(2) of this section. For each unique model type and footprint combination of the manufacturer’s automobiles, provide the information specified in paragraph (b)(3)(i) and (ii) of this section in tabular form. List the model types in order of increasing average inertia weight from top to bottom down the left side of the table and list the information categories in the order specified in paragraphs (b)(3)(i) and (ii) of this section from left to right across the top of the table. Other formats, such as those accepted by the EPA, which contain all the information in a readily identifiable format are also acceptable. For model year 2023 and later, for each unique model type and footprint combination of the manufacturer’s automobiles, provide the information specified in paragraph

(b)(3)(i) and (ii) of this section in accordance with the CAFE Projections Reporting Template (OMB Control No. 2127–0019, NHTSA Form 1474).

(i) In the case of passenger automobiles:

(A) Beginning model year 2013, base tire as defined in 49 CFR 523.2,

(B) Beginning model year 2013, front axle, rear axle, and average track width as defined in 49 CFR 523.2,

(C) Beginning model year 2013, wheelbase as defined in 49 CFR 523.2, and

(D) Beginning model year 2013, footprint as defined in 49 CFR 523.2.

(E) The fuel economy target value for each unique model type and footprint entry listed in accordance with the equation provided in 49 CFR Parts 531.

(ii) In the case of light trucks:

(A) Beginning model year 2013, base tire as defined in 49 CFR 523.2,

(B) Beginning model year 2013, front axle, rear axle, and average track width as defined in 49 CFR 523.2,

(C) Beginning model year 2013, wheelbase as defined in 49 CFR 523.2, and

(D) Beginning model year 2013, footprint as defined in 49 CFR 523.2.

(E) The fuel economy target value for each unique model type and footprint entry listed in accordance with the equation provided in 49 CFR Parts 533.

\* \* \* \* \*

(c) \* \* \*

(1) For each model type of the manufacturer's automobiles, provide the information specified in paragraph (c)(2) of this section in tabular form. List the model types in order of increasing average inertia weight from top to bottom down the left side of the table and list the

information categories in the order specified in paragraph (c)(2) of this section from left to right across the top of the table. For model year 2023 and later, CAFE reports required by §537, shall for each model type of the manufacturer's automobiles, provide the information in specified in paragraph (c)(2) of this section in accordance with the NHTSA CAFE Projections Reporting Template (OMB Control No. 2127-0019, NHTSA Form 1474) and list the model types in order of increasing average inertia weight from top to bottom.

\* \* \* \* \*

(3) (Pre-model year reports only through model year 2022.) For each vehicle configuration whose fuel economy was used to calculate the fuel economy values for a model type under paragraph (c)(2) of this section, provide the information specified in paragraph (c)(4) of this section in accordance with the NHTSA CAFE Projections Reporting Template (OMB Control No. 2127-0019, NHTSA Form 1474).

\* \* \* \* \*

(7) \* \* \*

(i) Provide a list of each air conditioning efficiency improvement technology utilized in your fleet(s) of vehicles for each model year. For each technology identify vehicles by make and model types that have the technology, which compliance category those vehicles belong to and the number of vehicles for each model equipped with the technology. For each compliance category (domestic passenger car, import passenger car, and light truck), report the air conditioning fuel consumption improvement value in gallons/mile in accordance with the equation specified in 40 CFR 600.510-12(c)(3)(i).

(ii) Provide a list of off-cycle efficiency improvement technologies utilized in your fleet(s) of vehicles for each model year that is pending or approved by the EPA. For each

technology identify vehicles by make and model types that have the technology, which compliance category those vehicles belong to, the number of vehicles for each model equipped with the technology, and the associated off-cycle credits (grams/mile) available for each technology. For each compliance category (domestic passenger car, import passenger car, and light truck), calculate the fleet off-cycle fuel consumption improvement value in gallons/mile in accordance with the equation specified in 40 CFR 600.510-12(c)(3)(ii).

(iii) Provide a list of full-size pickup trucks in your fleet that meet the mild and strong hybrid vehicle definitions. For each mild and strong hybrid type, identify vehicles by make and model types that have the technology, the number of vehicles produced for each model equipped with the technology, the total number of full-size pickup trucks produced with and without the technology, the calculated percentage of hybrid vehicles relative to the total number of vehicles produced, and the associated full-size pickup truck credits (grams/mile) available for each technology. For the light truck compliance category, calculate the fleet pickup truck fuel consumption improvement value in gallons/mile in accordance with the equation specified in 40 CFR 600.510-12(c)(3)(iii).

\* \* \* \* \*

21. Amend § 537.8 by revising paragraph (a)(3), paragraph (b)(4) and paragraph (c)(1), and adding paragraphs (a)(4) and (b)(4) to read as follows:

**§ 537.8 Supplementary reports.**

(a) \* \* \*

(3) For model years through 2022, each manufacturer whose pre-model or mid-model year report omits any of the information specified in § 537.7(b) or (c) shall file a supplementary report containing the information specified in paragraph (b)(3) of this section. Starting model year 2023, each manufacturer whose pre-model or mid-model year report omits any of the information shall resubmit the information with other information required in accordance with the NHTSA CAFE Projections Reporting Template (OMB Control No. 2127–0019, NHTSA Form 1474).

(b) \* \* \*

(4) The supplementary report required by paragraph (a)(4) of this section must contain:

(i) All information omitted from the pre-model or mid-model year reports under § 537.6(c)(2); and

(ii) Such revisions of and additions to the information submitted by the manufacturer in its pre-model or mid-model year reports regarding the automobiles produced during the current model year as are necessary to reflect the information provided under paragraph (b)(4)(i) of this section.

(c)(1) Each report required by paragraph (a)(1), (2), (3), or (4) of this section must be submitted in accordance with § 537.5(c) not more than 45 days after the date on which the manufacturer determined, or could have determined with reasonable diligence, that the report was required.

\* \* \* \* \*

**Environmental Protection Agency**

**40 CFR Chapter I**

For the reasons set forth in the preamble, the Environmental Protection Agency is amending part 86 of title 40, Chapter I of the Code of Federal Regulations as follows:

**PART 86—CONTROL OF EMISSIONS FROM NEW AND IN-USE HIGHWAY  
VEHICLES AND ENGINES**

1. The authority citation for part 86 continues to read as follows:

Authority: 42 U.S.C. 7401-7671q.

2. Section 86.1818-12 is amended by revising paragraphs (c)(2)(i)(A) through (C) and (c)(3)(i)(A), (B), and (D), to read as follows:

**§86.1818-12 Greenhouse gas emission standards for light-duty vehicles, light-duty trucks, and medium-duty passenger vehicles.**

\* \* \* \* \*

(c) \* \* \*

(2) \* \* \*

(i) \* \* \*

(A) For passenger automobiles with a footprint of less than or equal to 41 square feet, the gram/mile CO<sub>2</sub> target value shall be selected for the appropriate model year from the following table:

Model year	CO <sub>2</sub> target value (grams/mile)
2012	244.0
2013	237.0

2014	228.0
2015	217.0
2016	206.0
2017	195.0
2018	185.0
2019	175.0
2020	166.0
2021	161.8
2022	159.0
2023	156.4
2024	153.7
2025	151.2
2026 and later	148.6

(B) For passenger automobiles with a footprint of greater than 56 square feet, the gram/mile CO<sub>2</sub> target value shall be selected for the appropriate model year from the following table:

Model year	CO <sub>2</sub> target value (grams/mile)
2012	315.0

2013	307.0
2014	299.0
2015	288.0
2016	277.0
2017	263.0
2018	250.0
2019	238.0
2020	226.0
2021	220.9
2022	217.3
2023	213.7
2024	210.2
2025	206.8
2026 and later	203.4

(C) For passenger automobiles with a footprint that is greater than 41 square feet and less than or equal to 56 square feet, the gram/mile CO<sub>2</sub> target value shall be calculated using the following equation and rounded to the nearest 0.1 grams/mile, except that for any vehicle footprint the maximum CO<sub>2</sub> target value shall be the value specified for the same model year in paragraph (c)(2)(i)(B) of this section:

$$\text{Target CO}_2 = [a \times f] + b$$

Where:

$f$  is the vehicle footprint, as defined in §86.1803; and  $a$  and  $b$  are selected from the following table for the appropriate model year:

Model year	a	b
2012	4.72	50.5
2013	4.72	43.3
2014	4.72	34.8
2015	4.72	23.4
2016	4.72	12.7
2017	4.53	8.9
2018	4.35	6.5
2019	4.17	4.2
2020	4.01	1.9
2021	3.94	0.2
2022	3.88	-0.1
2023	3.82	-0.4
2024	3.77	-0.6
2025	3.71	-0.9

2026 and later	3.65	-1.2
----------------	------	------

\* \* \* \* \*

(3) \* \* \*

(i) \* \* \*

(A) For light trucks with a footprint of less than or equal to 41 square feet, the gram/mile CO<sub>2</sub> target value shall be selected for the appropriate model year from the following table:

Model year	CO <sub>2</sub> target value (grams/mile)
2012	294.0
2013	284.0
2014	275.0
2015	261.0
2016	247.0
2017	238.0
2018	227.0
2019	220.0
2020	212.0

2021	206.6
2022	203.1
2023	199.7
2024	196.3
2025	193.0
2026 and later	189.8

(B) For light trucks with a footprint that is greater than 41 square feet and less than or equal to the maximum footprint value specified in the table below for each model year, the gram/mile CO<sub>2</sub> target value shall be calculated using the following equation and rounded to the nearest 0.1 grams/mile, except that for any vehicle footprint the maximum CO<sub>2</sub> target value shall be the value specified for the same model year in paragraph (c)(3)(i)(D) of this section:

$$\text{Target CO}_2 = (a \times f) + b$$

Where:

*f* is the footprint, as defined in §86.1803; and *a* and *b* are selected from the following table for the appropriate model year:

Model year	Maximum footprint	a	b
2012	66.0	4.04	128.6
2013	66.0	4.04	118.7

2014	66.0	4.04	109.4
2015	66.0	4.04	95.1
2016	66.0	4.04	81.1
2017	50.7	4.87	38.3
2018	60.2	4.76	31.6
2019	66.4	4.68	27.7
2020	68.3	4.57	24.6
2021	73.5	4.51	21.7
2022	74.0	4.44	21.0
2023	74.0	4.38	20.3
2024	74.0	4.31	19.6
2025	74.0	4.25	19.0
2026 and later	74.0	4.18	18.3

\* \* \* \* \*

(D) For light trucks with a footprint greater than the minimum value specified in the table below for each model year, the gram/mile CO<sub>2</sub> target value shall be selected for the appropriate model year from the following table:

Model year	Minimum footprint	CO <sub>2</sub> target value (grams/mile)
2012	66.0	395.0
2013	66.0	385.0
2014	66.0	376.0
2015	66.0	362.0
2016	66.0	348.0
2017	66.0	347.0
2018	66.0	342.0
2019	66.4	339.0
2020	68.3	337.0
2021	73.5	329.7
2022	74.0	324.4
2023	74.0	319.2
2024	74.0	314.0
2025	74.0	308.9
2026 and later	74.0	303.9

\* \* \* \* \*

3. Section 86.1866-12 is amended by revising paragraph (a)(2), removing paragraph (a)(3), revising (b) introductory text, revising (b)(1), and revising (b)(2)(i) to read as follows:

**§86.1866-12 CO<sub>2</sub> credits for advanced technology vehicles.**

\* \* \* \* \*

(a) \* \* \*

(2) Model years 2017 through 2026: For electric vehicles, plug-in hybrid electric vehicles, and fuel cell vehicles produced for U.S. sale, where “U.S.” means the states and territories of the United States, in the 2017 through 2026 model years, such use of zero (0) grams/mile CO<sub>2</sub> is unrestricted.

(b) For electric vehicles, plug-in hybrid electric vehicles, fuel cell vehicles, dedicated natural gas vehicles, and dual-fuel natural gas vehicles as those terms are defined in §86.1803–01, that are certified and produced for U.S. sale in the specified model years and that meet the additional specifications in this section, the manufacturer may use the production multipliers in this paragraph (b) when determining additional credits for advanced technology vehicles. Full size pickup trucks eligible for and using a production multiplier are not eligible for the performance-based credits described in §86.1870-12(b).

(1) The production multipliers, by model year, for model year 2017 through 2021 electric vehicles and fuel cell vehicles are as follows:

Model year	Production multiplier
2017	2.0
2018	2.0

2019	2.0
2020	1.75
2021	1.5

(2)(i) The production multipliers, by model year, for model year 2017 through 2021 plug-in hybrid electric vehicles and model year 2017 through 2026 dedicated natural gas vehicles and dual-fuel natural gas vehicles are as follows:

Model year	Production multiplier
2017	1.6
2018	1.6
2019	1.6
2020	1.45
2021	1.3
2022-2026 (dedicated and dual fuel natural gas vehicles only)	2.0

\* \* \* \* \*

4. Section 86.1868-12 is amended by inserting a row at the bottom of the table in paragraph (a)(2) and by adding paragraph (h)(7) to read as follows:

**§86.1868-12 CO<sub>2</sub> credits for improving the efficiency of air conditioning systems.**

\* \* \* \* \*

(a) \* \* \*

(2) \* \* \*

Air conditioning technology	Passenger automobiles (g/mi)	Light trucks (g/mi)
* * * * *		
Advanced technology air conditioning compressor with improved efficiency relative to fixed-displacement compressors achieved through the addition of a variable crankcase suction valve.	1.1	1.1

\* \* \* \* \*

(h) \* \* \*

(7) *Advanced technology air conditioning compressor* means an air conditioning compressor with improved efficiency relative to fixed-displacement compressors. Efficiency gains are derived from improved internal valve systems that optimize the internal refrigerant flow across the range of compressor operator conditions through the addition of a variable crankcase suction valve.

5. Section 86.1869-12 is amended by revising paragraph (a), by adding paragraphs (b)(1)(ix), (b)(1)(x), (b)(4)(xiii) and (b)(4)(xiv), and by revising paragraph (d)(2) to read as follows:

**§86.1869-12 CO<sub>2</sub> credits for off-cycle CO<sub>2</sub> reducing technologies.**

\* \* \* \* \*

(a) Manufacturers may generate credits for CO<sub>2</sub>-reducing technologies where the CO<sub>2</sub> reduction benefit of the technology is not adequately captured on the Federal Test Procedure and/or the Highway Fuel Economy Test such that the technology would not be otherwise installed for purposes of reducing emissions (directly or indirectly) over those test cycles for compliance with the GHG standards. These technologies must have a measurable, demonstrable, and verifiable real-world CO<sub>2</sub> reduction that occurs outside the conditions of the Federal Test Procedure and the Highway Fuel Economy Test. These optional credits are referred to as “off-cycle” credits. The technologies must not be integral or inherent to the basic vehicle design, such as engine, transmission, mass reduction, passive aerodynamic design, and tire technologies. Technologies installed for non-off-cycle emissions related reasons are also not eligible as they would be considered part of the baseline vehicle design. The technology must not be inherent to the design of occupant comfort and entertainment features except for technologies related to reducing passenger air conditioning demand and improving air conditioning system efficiency. Notwithstanding the provisions of this paragraph (a), off-cycle menu technologies included in paragraph (b) of this section remain eligible for credits. Off-cycle technologies used to generate emission credits are considered emission-related components subject to applicable requirements and must be demonstrated to be effective for the full useful life of the vehicle. Unless the manufacturer demonstrates that the technology is not subject to in-use deterioration, the manufacturer must account for the deterioration in their analysis. Durability evaluations of off-cycle technologies may occur at any time throughout a model year, provided that the results can be factored into the data provided in the model year report. Off-cycle credits may not be

approved for crash-avoidance technologies, safety critical systems or systems affecting safety-critical functions, or technologies designed for the purpose of reducing the frequency of vehicle crashes. Off-cycle credits may not be earned for technologies installed on a motor vehicle to attain compliance with any vehicle safety standard or any regulation set forth in Title 49 of the Code of Federal Regulations. The manufacturer must use one of the three options specified in this section to determine the CO<sub>2</sub> gram per mile credit applicable to an off-cycle technology. Note that the option provided in paragraph (b) of this section applies only to the 2014 and later model years. The manufacturer should notify EPA in their pre-model year report of their intention to generate any credits under this section.

(b) \* \* \*

(1) \* \* \*

(ix) *High efficiency alternator*. The credit for a high efficiency alternator for passenger automobiles and light trucks shall be calculated using the following equation, and rounded to the nearest 0.1 grams/mile:

$$Credit \left( \frac{g}{mi} \right) = (VDA_{HEA} - 67) \times 0.16$$

Where:

VDA<sub>HEA</sub> is the ratio of the alternator output power to the power supplied to the alternator, as measured using the Verband der Automobilindustrie (VDA) efficiency measurement methodology and expressed as a whole number percent from 68 to 100.

\* \* \* \* \*

(4) \* \* \*

(xiii) *High efficiency alternator* means an alternator where the ratio of the alternator output power to the power supplied to the alternator is greater than 67 percent, as measured using the Verband der Automobilindustrie (VDA) efficiency measurement methodology.

\* \* \* \* \*

(d) \* \* \*

(2) *Notice and opportunity for public comment.*

(i) The Administrator will publish a notice of availability in the Federal Register notifying the public of a manufacturer's proposed alternative off-cycle credit calculation methodology. The notice will include details regarding the proposed methodology but will not include any Confidential Business Information. The notice will include instructions on how to comment on the methodology. The Administrator will take public comments into consideration in the final determination and will notify the public of the final determination. Credits may not be accrued using an approved methodology until the first model year for which the Administrator has issued a final approval.

(ii) The Administrator may waive these notice and comment requirements for technologies for which EPA has previously approved a methodology for determining credits. To qualify for this waiver, the new application must be substantially identical in form, content, and methodology to the application for a previously approved methodology, and must include the following:

(A) A cite to the appropriate previously approved methodology, including the appropriate Federal Register Notice and any subsequent EPA documentation of the Administrator's decision;

(B) All necessary manufacturer- and vehicle-specific test data, modeling, and credit calculations; and,

(C) Any other vehicle- or technology-specific details required pursuant to the previously approved methodology to assess and support an appropriate credit value.

(iii) A waiver of the notice and comment requirements does not imply a determination that a specific credit value for a given technology is appropriate, and nor does it imply a waiver from the requirements in paragraphs (d)(1) and (e) of this section.

(iv) The Administrator retains the option to require a notice and opportunity for public comment in cases where a new application deviates in significant respects from a previously approved methodology or raises novel substantive issues.

\* \* \* \* \*

6. Section 86.1870-12 is amended by revising paragraphs (a)(2) and (b)(2) to read as follows:

**§86.1870-12 CO2 credits for qualifying full-size light pickup trucks.**

\* \* \* \* \*

(a) \* \* \*

(2) Full size pickup trucks that are strong hybrid electric vehicles and that are produced in the 2017 through 2021 model years are eligible for a credit of 20 grams/mile. To receive this credit in a model year, the manufacturer must produce a quantity of strong hybrid electric full size pickup trucks such that the proportion of production of such vehicles, when compared to the manufacturer's total production of full size pickup trucks, is not less than 10 percent in that model year.

\* \* \* \* \*

(b) \* \* \*

(2) Full size pickup trucks that are produced in the 2017 through 2021 model years and that achieve carbon-related exhaust emissions less than or equal to the applicable target value determined in §86.1818-12(c)(3) multiplied by 0.80 (rounded to the nearest gram/mile) in a model year are eligible for a credit of 20 grams/mile. A pickup truck that qualifies for this credit in a model year may claim this credit for a maximum of four subsequent model years (a total of five consecutive model years) if the carbon-related exhaust emissions of that pickup truck do not increase relative to the emissions in the model year in which the pickup truck first qualified for the credit. This credit may not be claimed in any model year after 2021. To qualify for this credit in a model year, the manufacturer must produce a quantity of full size pickup trucks that meet the emission requirements of this paragraph (b)(2) such that the proportion of production of such vehicles, when compared to the manufacturer's total production of full size pickup trucks, is not less than 10 percent in that model year.

\* \* \* \* \*

7. Section 600.113-12 is amended by revising paragraphs (n) introductory text, (n)(1), and (n)(3) to read as follows:

**§600.113-12 Fuel economy, CO<sub>2</sub> emissions, and carbon-related exhaust emission calculations for FTP, HFET, US06, SC03 and cold temperature FTP tests.**

\* \* \* \*

(n) Manufacturers shall determine CO<sub>2</sub> emissions and carbon-related exhaust emissions for electric vehicles, fuel cell vehicles, and plug-in hybrid electric vehicles according to the provisions of this paragraph (n). Subject to the limitations on the number of vehicles produced and delivered for sale as described in §86.1866 of this chapter, the manufacturer may be allowed to use a value of 0 grams/mile to represent the emissions of fuel cell vehicles and the proportion of electric operation of a electric vehicles and plug-in hybrid electric vehicles that is derived from electricity that is generated from sources that are not onboard the vehicle, as described in paragraphs (n)(1) through (3) of this section. For purposes of labeling under this part, the CO<sub>2</sub> emissions for electric vehicles shall be 0 grams per mile. Similarly, for purposes of labeling under this part, the CO<sub>2</sub> emissions for plug-in hybrid electric vehicles shall be 0 grams per mile for the proportion of electric operation that is derived from electricity that is generated from sources that are not onboard the vehicle. For all 2027 and later model year electric vehicles, fuel cell vehicles, and plug-in hybrid electric vehicles, the provisions of this paragraph (n) shall be used to determine the non-zero value for CREE for purposes of meeting the greenhouse gas emission standards described in §86.1818 of this chapter.

(1) For electric vehicles, but not including fuel cell vehicles, the carbon-related exhaust emissions in grams per mile is to be calculated using the following equation and rounded to the nearest one gram per mile:

$$\text{CREE} = \text{CREEUP} - \text{CREEGAS}$$

Where:

CREE means the carbon-related exhaust emission value as defined in §600.002, which may be set equal to zero for eligible 2012 through 2026 model year electric vehicles as described in §86.1866-12(a) of this chapter.

$$CREE_{UP} = \frac{EC}{GRIDLOSS} \times AVGUSUP, \text{ and}$$

$$CREE_{GAS} = \frac{2478}{8887} \times TargetCO_2,$$

Where:

EC = The vehicle energy consumption in watt-hours per mile, for combined FTP/HFET operation, determined according to procedures established by the Administrator under §600.116-12.

GRIDLOSS = 0.935 (to account for grid transmission losses).

AVGUSUP = 0.534 (the nationwide average electricity greenhouse gas emission rate at the powerplant, in grams per watt-hour).

2478 is the estimated grams of upstream greenhouse gas emissions per gallon of gasoline.  
8887 is the estimated grams of CO<sub>2</sub> per gallon of gasoline.

TargetCO<sub>2</sub> = The CO<sub>2</sub> Target Value for the fuel cell or electric vehicle determined according to §86.1818 of this chapter for the appropriate model year.

\* \* \* \* \*

(3) For 2012 and later model year fuel cell vehicles, the carbon-related exhaust emissions in grams per mile shall be calculated using the method specified in paragraph (n)(1) of this section, except that CREEUP shall be determined according to procedures established by the

Administrator under §600.111-08(f). As described in §86.1866 of this chapter, the value of CREE may be set equal to zero for 2012 through 2026 model year fuel cell vehicles.

\* \* \* \* \*

8. Section 600.510-12 is amended by revising paragraphs (c)(2)(vi) introductory text, by inserting paragraph (c)(2)(vii) introductory text, by revising paragraph (c)(2)(vii)(B) introductory text, by revising (j)(2)(v) introductory text, by inserting paragraph (j)(2)(vi) introductory text, and by revising paragraph (j)(2)(vi)(B) introductory text to read as follows:

**§600.510-12 Calculation of average fuel economy and average carbon-related exhaust emissions.**

\* \* \* \* \*

(c) \* \* \*

(2) \* \* \*

(vi) For natural gas dual fuel model types, for model years 1993 through 2016, and optionally for 2021 and later model years, the harmonic average of the following two terms; the result rounded to the nearest 0.1 mpg:

\* \* \* \* \*

(vii) This paragraph (c)(2)(vii) applies to model year 2017 through 2020 natural gas dual fuel model types. Model year 2021 and later natural gas dual fuel model types may use the provisions of paragraph (c)(2)(vi) of this section or this paragraph (c)(2)(vii).

\* \* \* \* \*

(B) Model year 2017 through 2020 natural gas dual fuel model types must meet the following criteria to qualify for use of a Utility Factor greater than 0.5:

\* \* \* \* \*

(j) \* \* \*

(2) \* \* \*

(v) For natural gas dual fuel model types, for model years 2012 through 2015, and optionally for 2021 and later model years, the arithmetic average of the following two terms; the result rounded to the nearest gram per mile:

\* \* \* \* \*

(vii) This paragraph (j)(2)(vii) applies to model year 2016 through 2020 natural gas dual fuel model types. Model year 2021 and later natural gas dual fuel model types may use the provisions of paragraph (j)(2)(v) of this section or this paragraph (j)(2)(vii).

\* \* \* \* \*

(B) Model year 2016 through 2020 natural gas dual fuel model types must meet the following criteria to qualify for use of a Utility Factor greater than 0.5:

\* \* \* \* \*

**The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks**

Dated: March 30, 2020.

---

Andrew Wheeler,  
Administrator,  
Environmental Protection Agency

**The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks**

Issued on March 30, 2020 in Washington, D.C., under authority delegated in 49 CFR 1.95 and 501.5
