

Diet of introduced American bullfrog (*Lithobates catesbeianus*) after five years of control shows decreased conspecific and plant usage.

Lee Lynn Michel / Ivan Arismendi
Oregon State University

Concerns

- Predation
- Reorganization of the food web,
- Changes in nutrient flows and sinks
- Spread pathogens
- Extinction of species

(Bucciarelli et al. 2014; Kraus 2015; Nicholson et al. 2020)

The removal of an invasive species can have unintended consequences

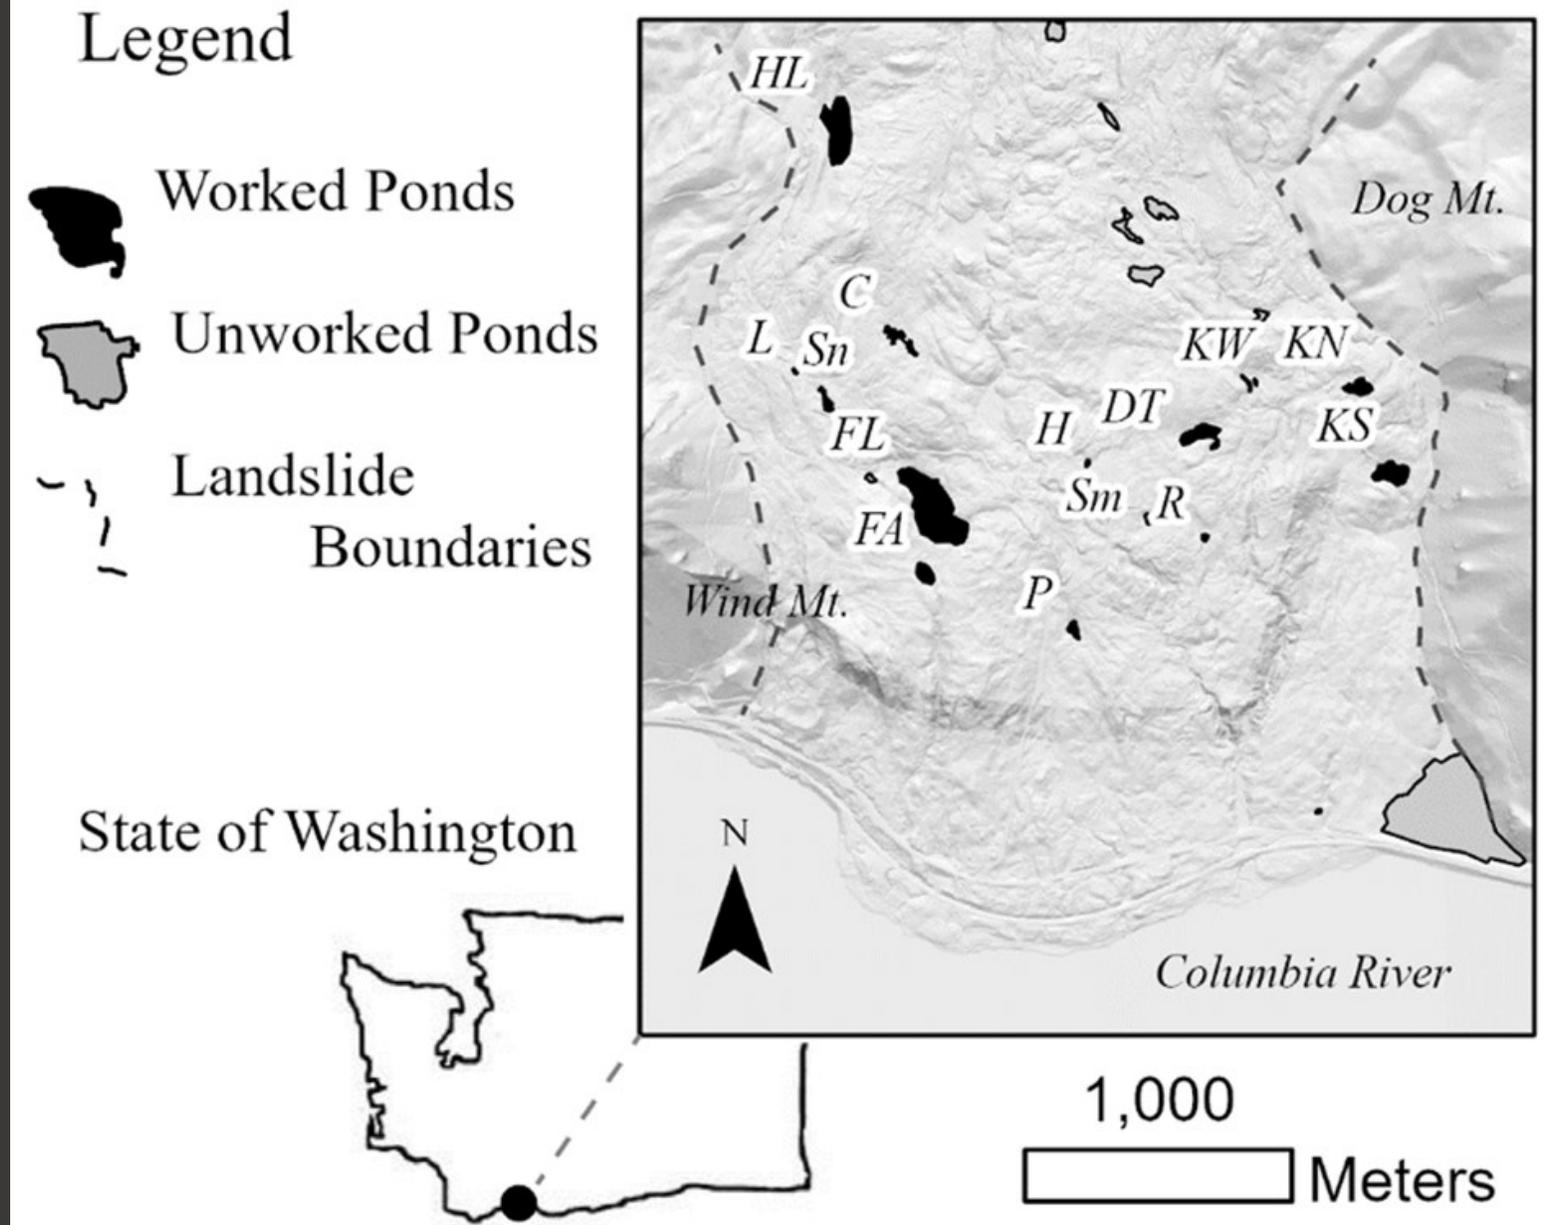

- Sheep on Santa Cruz Island in California - 23% increase in woody overstory (Beltran et al. 2014)
- Fish in Sydney, Australia resulted - native tadpole abundance x140 (Pollard et al., 2017)
- Cats - > Pacific rat - < breeding success of Cook's petrel in New Zealand (Rayner et al. 2007)

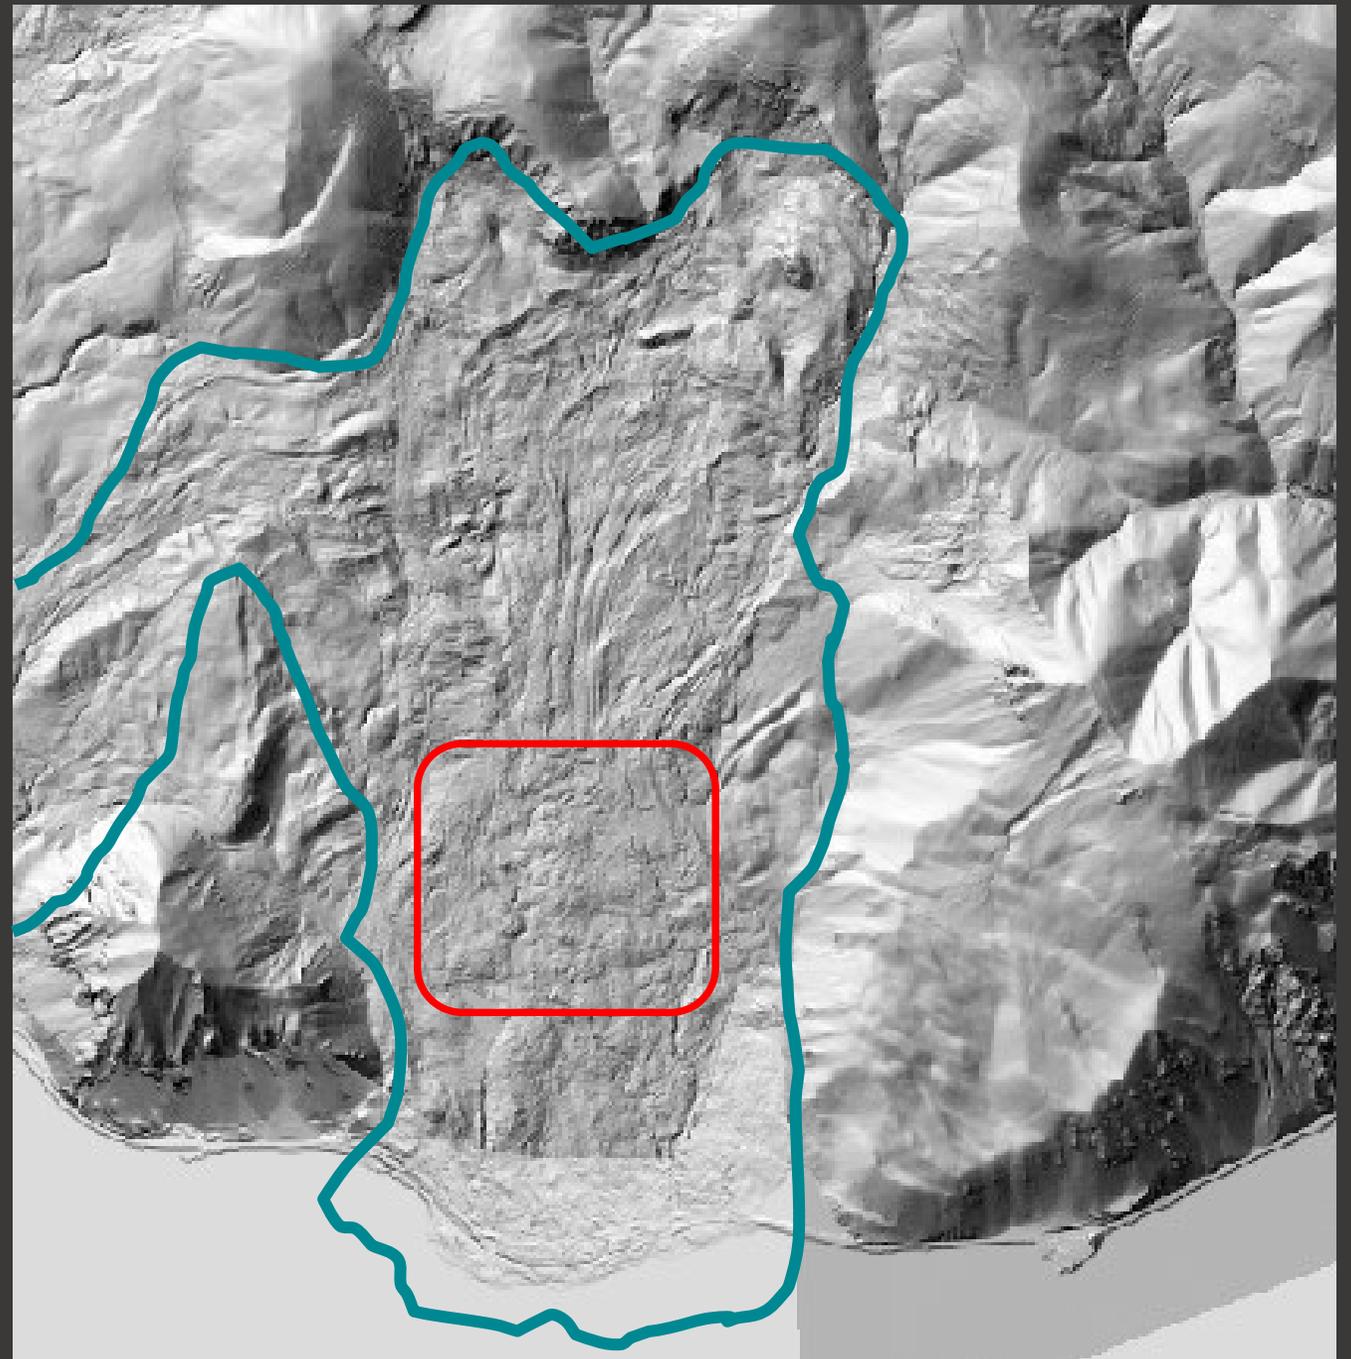

What happens to their diet as bullfrog densities fall?

Study site

- ~ 1300 acres
- 30+ ponds
- Temperate
- Bordered by two mountains and the Columbia River

Why does it matter?

Floating macrophytes
(de Tezanos et al. 2014)

Temperatures, pH, light infiltration

2016

2021

Control Level?

No control

Control

Complete extirpation

Limitations

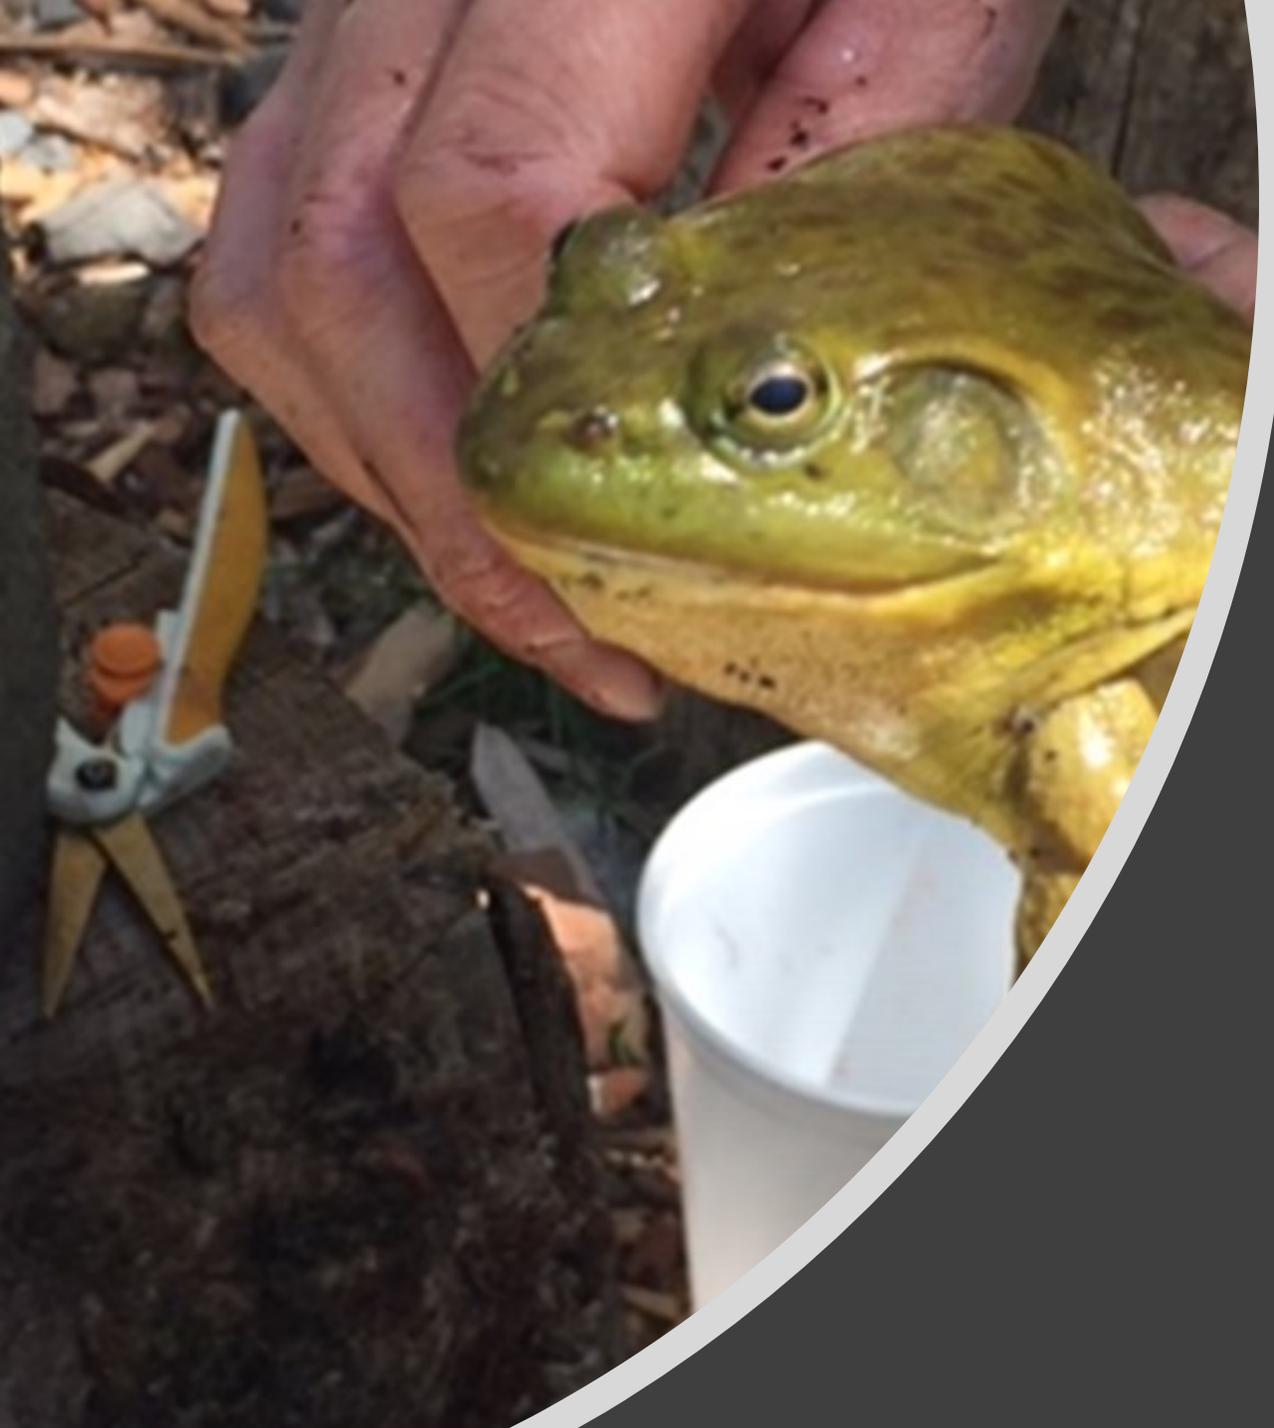

- Data created from control work not systematic sampling
- Expertise level in Arthropod identification
- No trophic level availability information

Additional Research

- Pond productivity as control work progresses
- How does the bullfrog hunting strategy change
