2-STEP PROCESS

cleaning the places
people work and
gather

CORPORATE BUILDING
SERVICES, INC.

1. CLEANING

A chemical wipe-down of surfaces is the necessary first step to disinfecting since germs may be lingering under a soil film layer.

2. DISINFECTING

A registered EPA disinfectant is sprayed on all surfaces to kill the germs left after cleaning.

Cleaning and disinfecting are part of a broad approach to preventing infectious diseases and the spread of germs such as bacteria and viruses.

CORONAVIRUS

* According to the CDC

TECHNOLOGY

CORPORATE BUILDING
SERVICES, INC.

Corporate Building Services always makes use of the latest cutting-edge technology.

While disinfectants are effective no matter how they are applied to a surface – spray bottle, pump-up sprayer, fogger – the thoroughness of coverage on any surface is dependent upon the technology used.

Electrostatic Sprayer Technology

- CBS uses this technology in the application of disinfectants for germ control.
- This technology adds a positive electrical charge to the disinfectant chemical and then atomizes it as it is sprayed creating a magnetic attraction between the spray droplets and the targeted surface.
- This electrical charge draws the atomized disinfectant where it wraps itself 360° around objects and binds to all surfaces.
